IDEA:

- **CityGML 3D City Database:** Why not letting users benefit from *directly* working with the 3DCityDB?
 - No need to work with files
 - Editing of features attributes could become way easier
 - SQL/relational model are rather well-known in and outside the GIS user community
 - Last but not least.... "3D city models belong best in a database" ☺

Motivation

BUT:

- 3DCityDB structure is rather complex
 - Lots of nested tables, intricate structure
 - Data management is difficult, although some functions are provided (e.g. delete functions)
 - There can be multiple citydb schemas in the same database instance (aka "scenarios")
- CityGML does not follow the Simple Feature for SQL model (SFS)
 - Nested features
 - One feature can have multiple representations (multiple LoDs, multiple geometry types)
- The existing **Importer/Exporter** offers some functionalities, but its *raison d'être* is basically different (...as the name says!)

Motivation

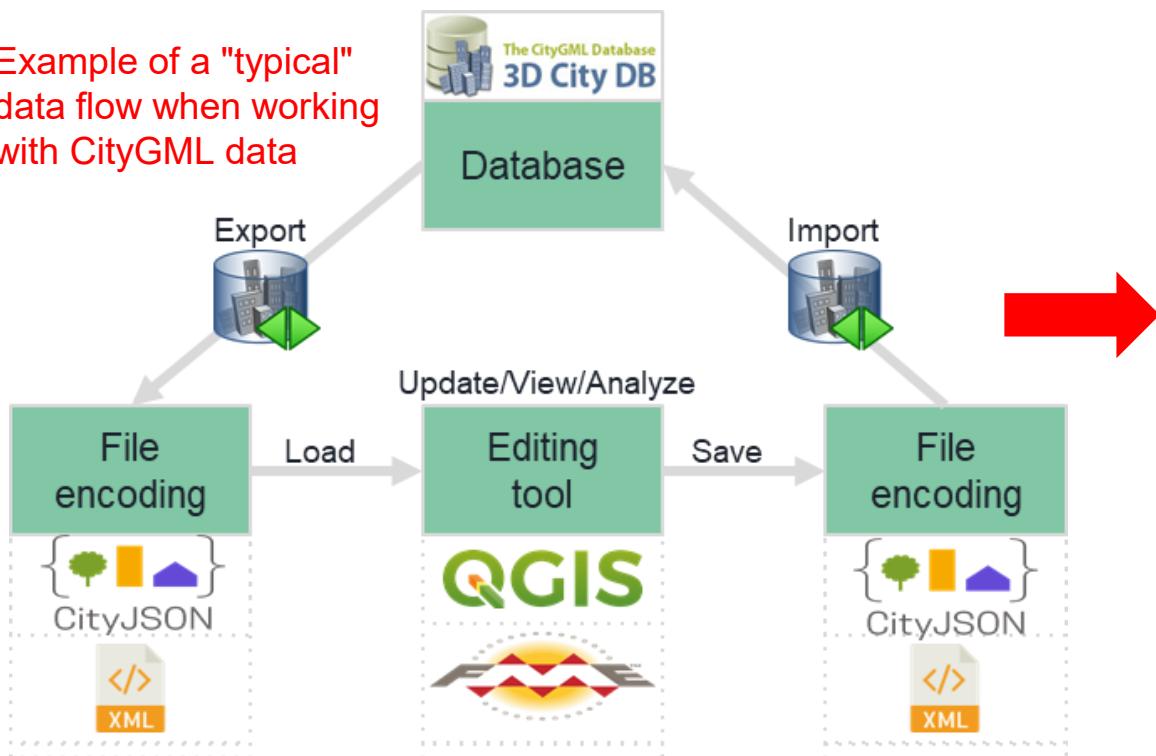

SO:

- Why not using **QGIS**?
 - Well-known and established open-source software
 - Rather mature, version 3.28 LTR released in autumn 2022, well documented
 - Native support for PostgreSQL/PostGIS, and for Oracle Spatial
 - Has strong 2D and some (less mature) 3D visualisation functionalities
 - Can be extended with Python-based plugins

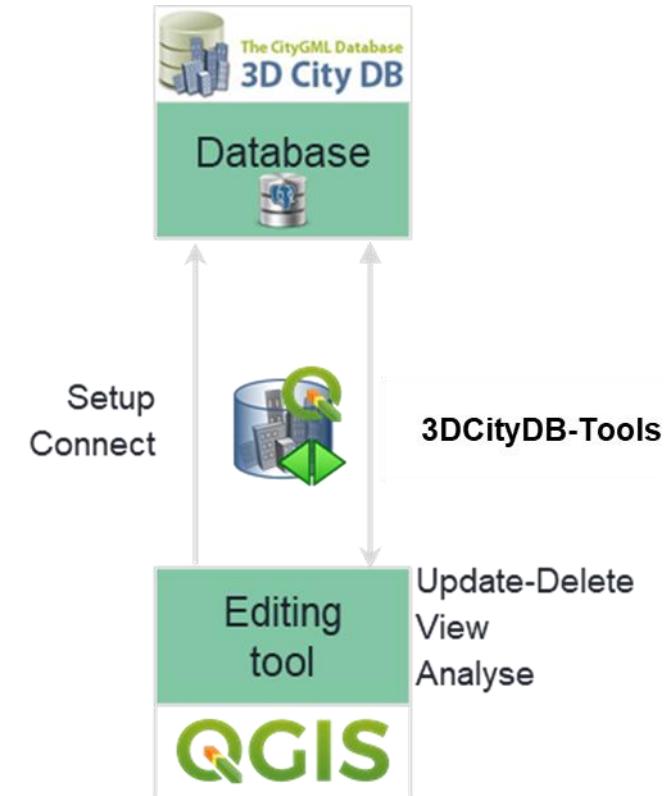

Motivation

Example of a "typical" data flow when working with CityGML data

Goal of the plugin

Main functionalities

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

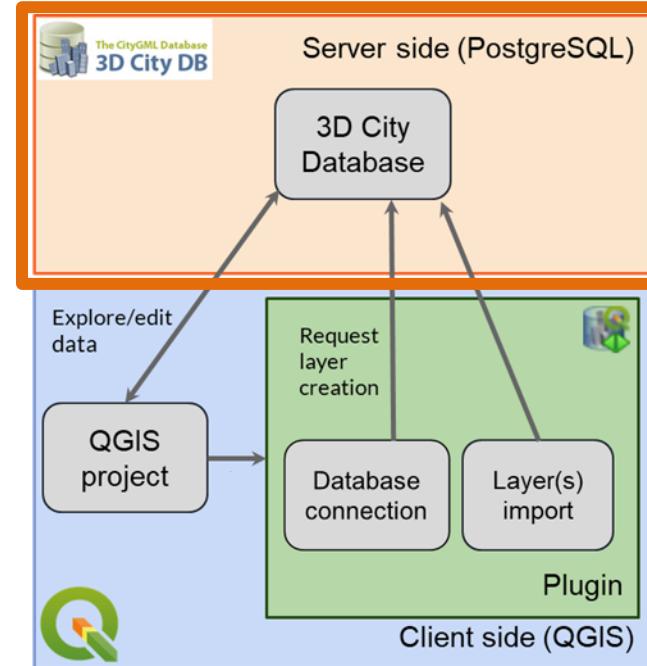

- Create "**SFS-like layers**" to hide 3DCityDB complexity when interacting with data
 - Deal efficiently with multi-LoD / different geometries / implicit representations
 - Up to ≈600 possible combinations in CityGML!
 - Merge all standard attributes of a CityObject into a single "table"
- **Deal with the possibly huge size of city models** stored in a database
- Support for **multiple citydb schemas** in the same 3DCityDB instance
- Support for **multiple users with different privileges** (read-only, read-write)
- **Editing of attributes:** possible (depending on user privileges)
- **Deletion of features:** possible (depending on user privileges)
- Editing of geometries: NOT possible

Plugin overview

Current limitations
QGIS Package
Resources

Server-side PostgreSQL "QGIS Package"

- Creates and manages layers as views (for attributes) linked to materialized views (for geometry) following the SFS model
- Manages
 - users and privileges
 - multiple citydb schemas
- Adds default users with ro & rw privileges

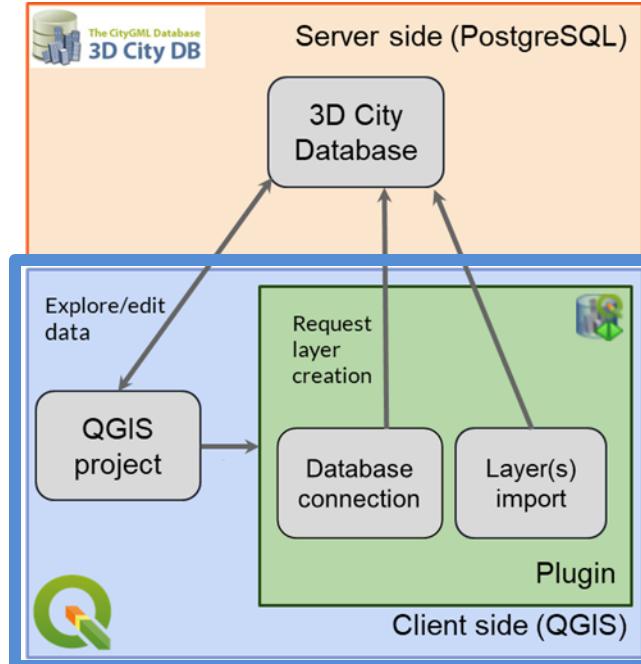

Plugin overview

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

Client-side

QGIS plugin “3DCityDB-Tools”

- Manages database connections + installation of the **QGIS Package**
- Allows for GUI-based
 - layer creation and management
 - management of multiple citydb schemas
 - editing of feature attributes
- GUI includes
 - support for children tables (e.g. generic attributes)
 - CityGML enumerations
 - Codelists
- Creates a hierarchical Table of Contents

IMPORTANT NOTICE

The following slides assume that you are already familiar with the **3DCityDB Suite**

In particular you should:

- Have an already installed 3DCityDB database instance
- Be able to use the 3DCityDB Importer/Exporter
- Be able to import CityGML data into the 3DCityDB
- (Optionally) be able to create additional citydb schemas

Otherwise:

- Refer to the slides in "**3DCityDB_Suite_QuickInstall.pdf**" (also in the same folder of this file) and/or
- Follow the tutorial: <https://github.com/3dcitydb/tutorials>

Last but not least...

- You may profit from a basic knowledge of the main CityGML concepts 😊
- Otherwise, here a crash course for free: <http://www.urbangeobigdata.it/?p=195>

QGIS version	3DCityDB-Tools works?	Comments
QGIS 3.44 LTR		Works. Used for development since v. 0.8.13
QGIS 3.42		Not supported, but it generally works
QGIS 3.40 LTR		Works
QGIS 3.34 LTR		Not tested, but it <i>should</i> work (unsupported LTR)
QGIS 3.28 LTR		Not tested, but it <i>should</i> work (unsupported LTR)
QGIS 3.22 LTR		Not tested, but it <i>should</i> work (unsupported LTR)
QGIS ≤ 3.20		Not supported, most likely does not work

Testing machines

Machines used for development and testing:

OS	Processor(s)	HD	RAM	PostgreSQL	PostGIS
Windows 11 24H2 64bit	Core i7-1355U 1.7 GHz	SSD 2 TB	32 GB	18, 64bit	3.6
Mac OS (11.6.2 64bit)	Core i9-9980HK	HDD 1TB	32 GB	14, 64bit	3.1
Ubuntu 22.04 LTS 64bit	Virtual Machine	HDD 2 TB	16 GB	16, 64bit	3.5
Ubuntu 22.04 LTS 64bit	Virtual Machine	100 GB	8 GB	14, 64 bit	3.2

Manual installation

Front-end installation

The **Database menu** will now contain a new entry, and the icons will be visible in the database icon bar (if the icon bar is activated)

Back-end installation

The back-end installation consists in installing the **QGIS Package** into a 3DCityDB instance. It can be carried out using the "QGIS Package Administrator" GUI of the front-end. The **database administrator** is responsible for setting up in advance the server-side for *any* database user.

In general, **4 steps** are necessary:

- a) Installation of the QGIS Package (i.e. the "qgis_pkg" schema)
- b) Selection of the database users (e.g. "giorgio")
- c) Creation of a user schema for each selected user (e.g. "qgis_giorgio")
- d) Definition of the database privileges for each user and for each citydb schema (i.e. "read-only", "read & write", "none")

It is possible to perform:

- A "**simplified installation**", which carries out all 4 operation at once and automatically installs 2 default users
- A "**normal installation**", where the administrator has complete control over each step

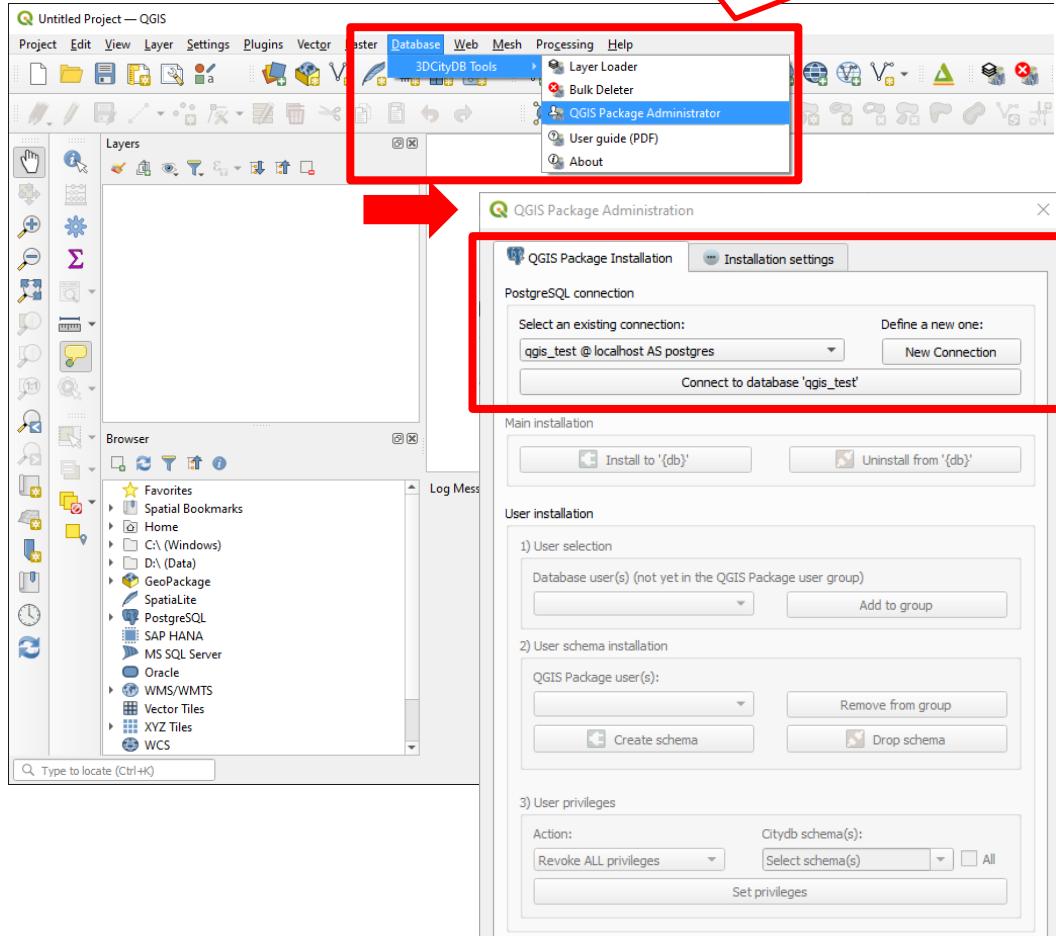

Back-end installation

Watch out! Pick the QGIS Package Administrator!

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package Resources

As **database administrator**
(e.g. "postgres"):

- 1) Create a new connection or use an existing one to the desired 3DCityDB instance (here: "qgis_test")

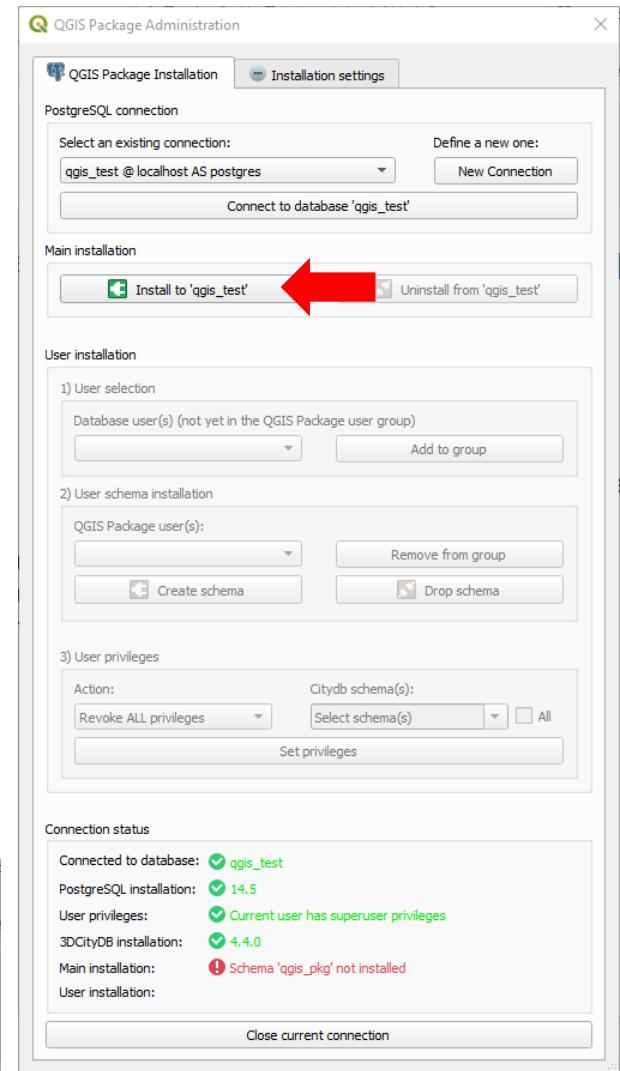

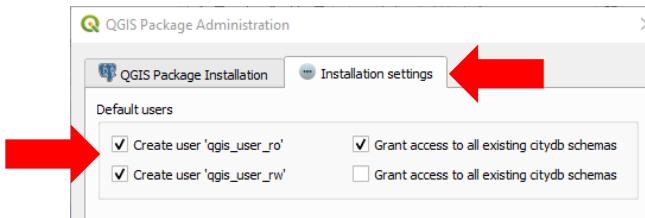

Back-end installation

2.1) "Simplified" installation

The QGIS Package and up to two default users are installed at once:

- User "`qgis_user_ro`" with read-only privileges
- User "`qgis_user_rw`" with read & write privileges
- Both users have access to all citydb schemas in the database at the moment of the installation
- **Note bene:** Their privileges and access rules can be changed at *any* time after installation. See later the "normal"-installation slides

Before clicking the Install button, go to the "Installation settings" tab and check the desired options

This screenshot shows the main interface of the QGIS Package Administration tool. In the 'Main installation' section, there is a 'Install to' button next to the database name 'qgis_test', which is highlighted by a red arrow. Another red arrow points to the 'Installation settings' tab at the top left of the window.

Back-end installation

2.1) "Simplified" installation

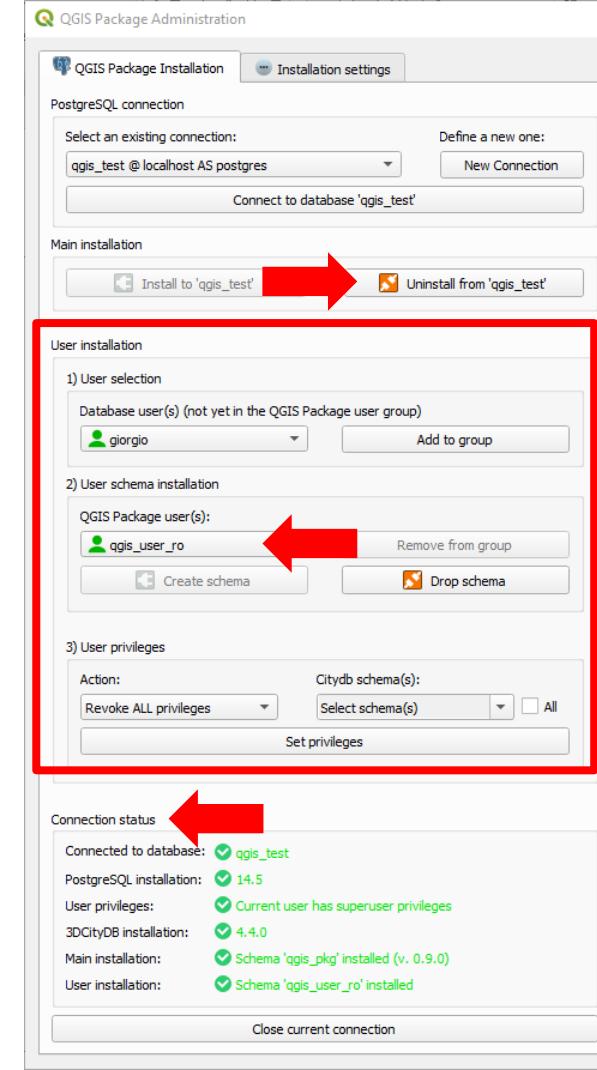

Upon successful installation:

- The **Uninstall button** is activated (in case you want to uninstall the QGIS Package)
- The **User Installation box** is activated
- You are notified in the **Connection status**

Done! 😊 Close the "QGIS Package Administration" GUI. You can now start using the plugin (e.g. the "Layer Loader" or the "Bulk Deleter") using the credentials of one of the default users

Please observe that:

- The default user(s) are automatically added to the **QGIS Package user(s)**
- You can edit the privileges in the **User privileges box**, or leave them as they are

Back-end installation

2.1) "Simplified" installation

In the 3DCityDB, the **qgis_pkg** schema is added and, depending on the chosen options, the **qgis_user_ro** and/or the **qgis_usr_rw** schemas are created, too

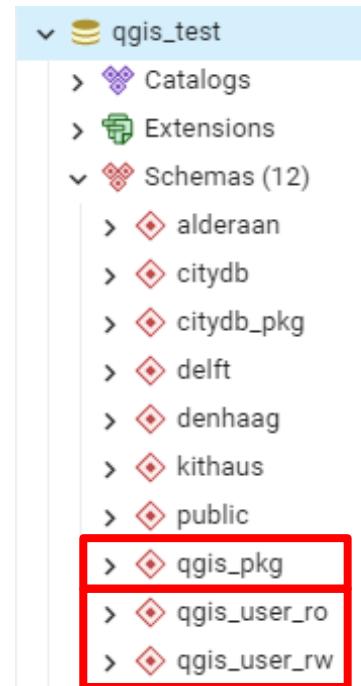

The credentials for the default users are:

User "qgis_user_ro":

- user name: **qgis_user_ro**
- password: **qgis_user_ro**

User "qgis_user_rw":

- user name: **qgis_user_rw**
- password: **qgis_user_rw**

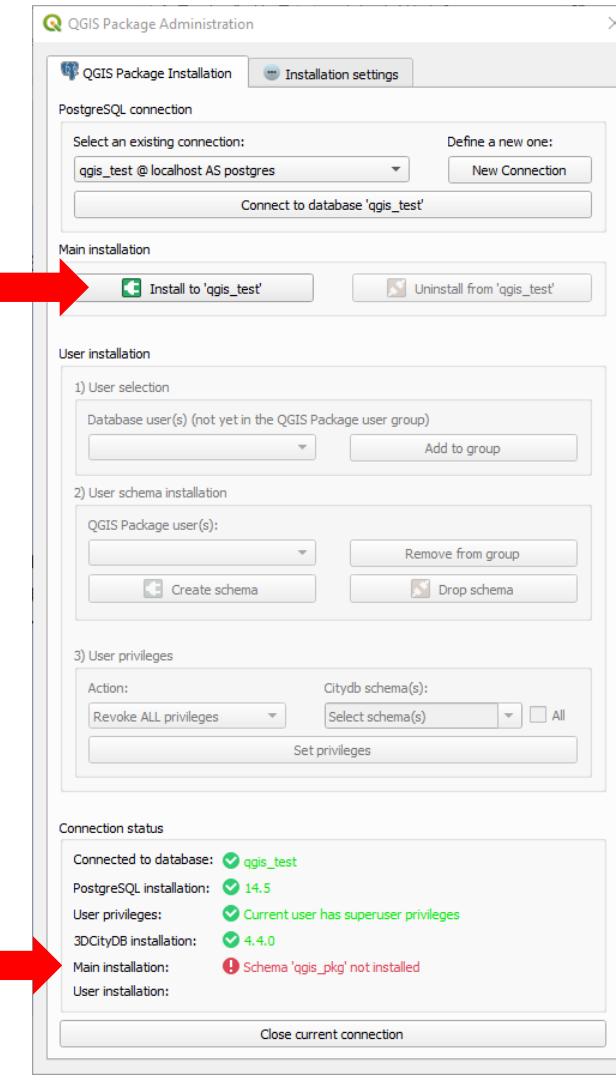

Back-end installation

2.2) "Normal" installation

Using the "normal" installation, the administrator has complete control over each one of the 4 required installation steps

Step a) To install the GIS Package, click the **Install button** (here: install to database "qgis_test")

The **Connection status box** in the lower part of the dialog will keep you informed.

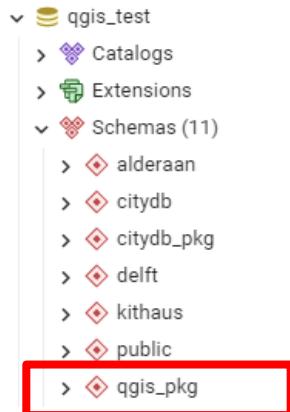

Back-end installation

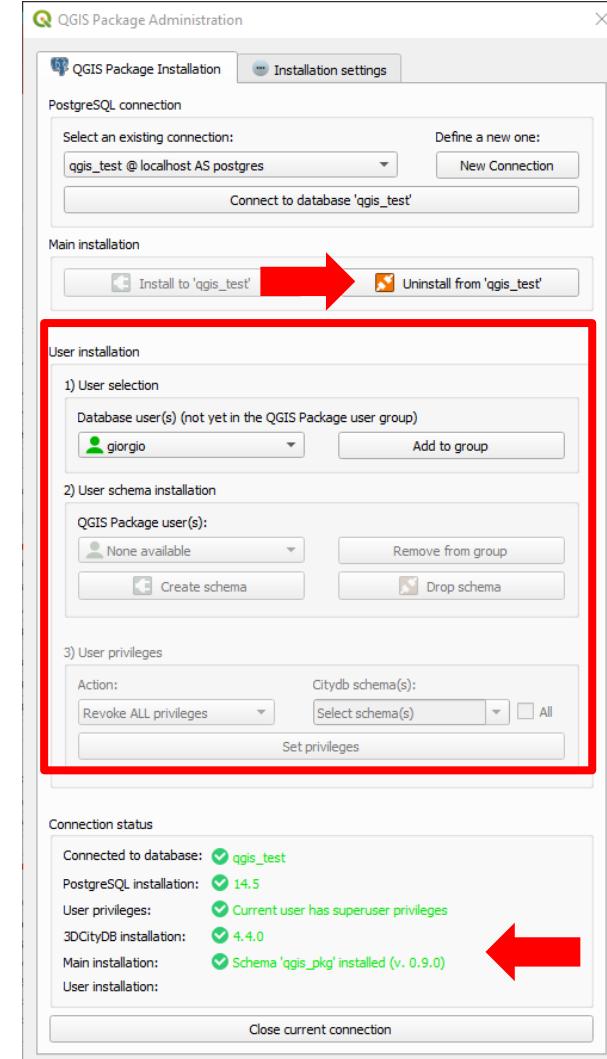

2.2) "Normal" installation

Upon successful installation:

- The **Uninstall button** is activated (in case you want to immediately uninstall)
- The **User Installation box** is activated
- You are notified in the **Connection status box**

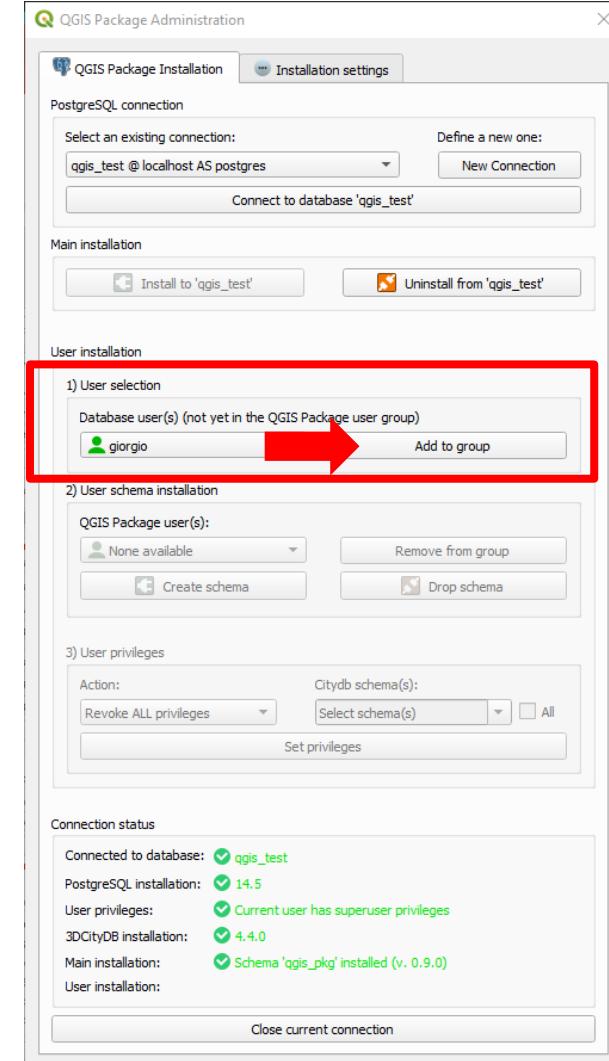

The "**qgis_pkg**" schema is created in the the selected current database

Back-end installation

2.2) "Normal" installation

Step b) Choose from all database users the one(s) to add to the QGIS Package user group. Click the **Add to group** button

The screenshot shows the 'QGIS Package Administration' window. In the 'User selection' section, there is a list of 'Database user(s) (not yet in the QGIS Package user group)' with 'giorgio' selected. To the right of the list is a red arrow pointing to the 'Add to group' button, which is also highlighted with a red box.

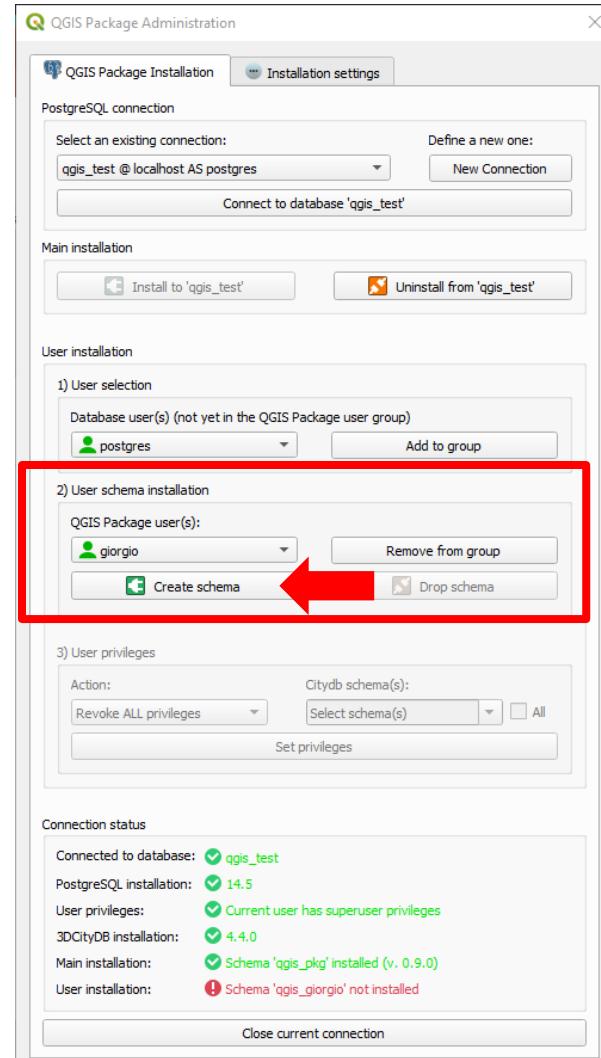

For each 3DCityDB there group named "**qgis_pkg_usrgroup_**" + **database name** is created. It contains those users that will be allowed to interact with the database from the front-end.
Example: for database "qgis_test" there is a group called "qgis_pkg_usrgroup_qgis_test".

Back-end installation

2.2) "Normal" installation

Step c) Create the user schema for the selected user(s) belonging to the group

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

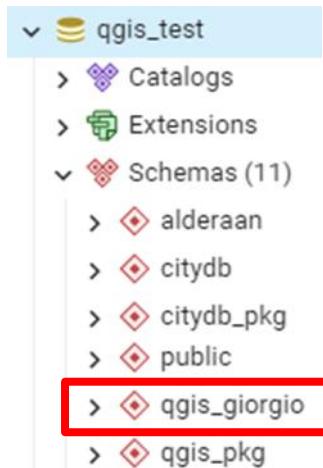

Back-end installation

2.2) "Normal" installation

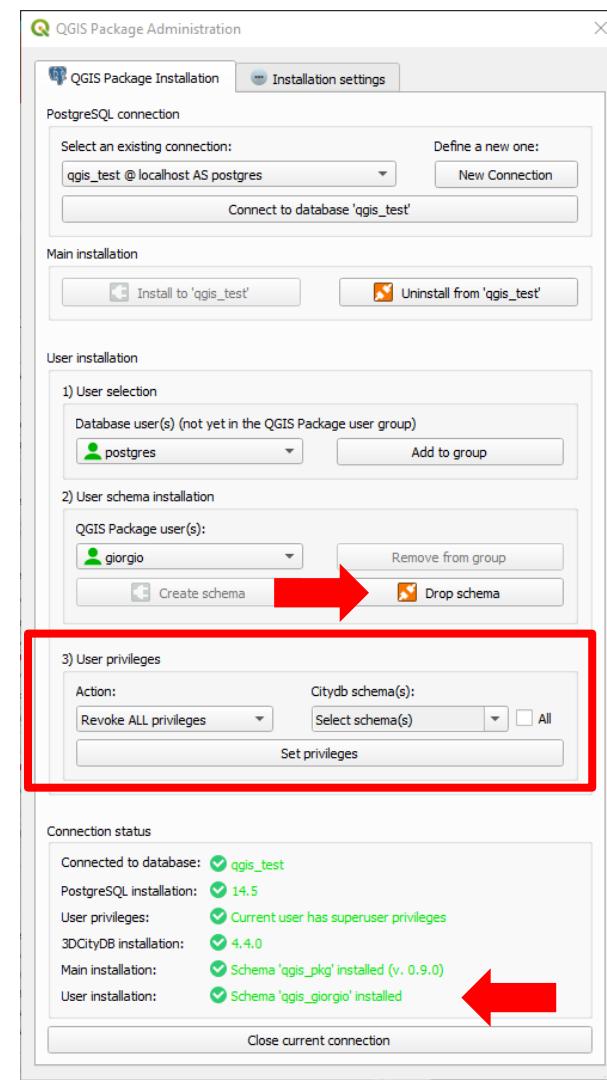

Upon successful creation of the user schema:

- The **Drop schema** button is activated (in case you want to drop the schema you just created)
- the **User privileges box** is activated
- You are notified in the **Connection status box**

A schema named "**qgis_**" + **user name** is created.

Example: for user "giorgio", schema "qgis_giorgio" will be created.

QGIS Package Administration

QGIS Package Installation Installation settings

Select an existing connection: qgis_test @ localhost AS postgres Define a new one: New Connection

PostgreSQL connection: qgis_test @ localhost AS postgres Connect to database 'qgis_test'

Main installation: Install to 'qgis_test' Uninstall from 'qgis_test'

User installation:

- 1) User selection: Database user(s) (not yet in the QGIS Package user group): postgres Add to group
- 2) User schema installation: QGIS Package user(s): giorgio Remove from group
- 3) User privileges: Action: Revoke ALL privileges Citydb schema(s): Select schema(s) All

Connection status: Connected to database: qgis_test PostgreSQL installation: 14.5 User privileges: Current user has superuser privileges 3DCityDB installation: 4.4.0 Main installation: Schema 'qgis_pkg' installed (v. 0.9.0) User installation: Schema 'qgis_giorgio' installed

Close current connection

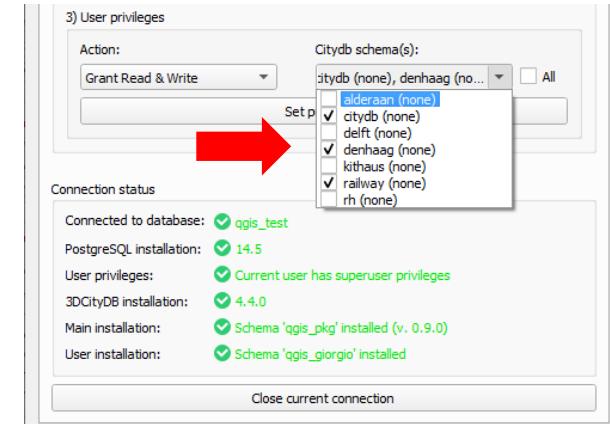

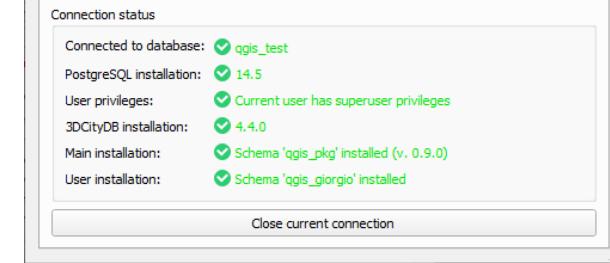

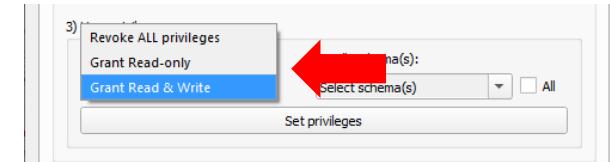

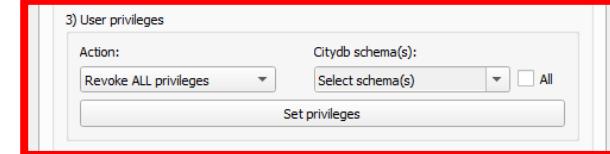

Back-end installation

2.2) "Normal" installation

Step d) For the selected user, set the database privileges ("read-only", "read & write", "none") for each of the existing citydb schemas

You can assign different privileges to different citydb schemas – or revoke them.

Click the **Set privileges** button to apply the settings. The privileges status in the drop down menu will be updated accordingly.

Back-end installation

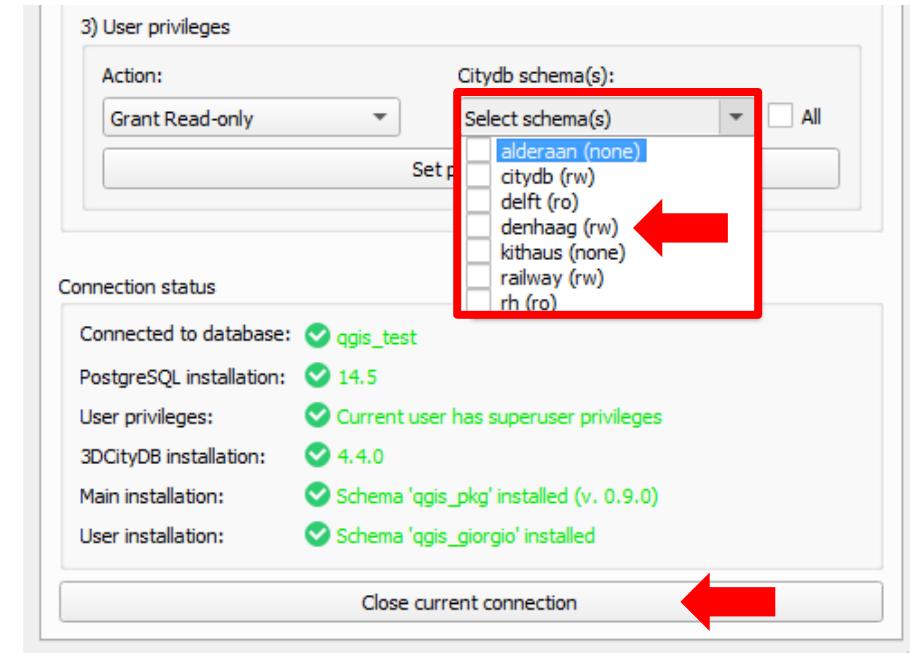

2.2) "Normal" installation

- Software use**
 - Layer Loader
 - Bulk Deleter
 - About, etc.
- Advanced options
- Software uninstall
- Current limitations
- QGIS Package
- Resources

The screenshot shows the QGIS application interface. A red box highlights the "Database" menu bar, and a red arrow points to the "Layer Loader" option under the "3DCityDB Tools" submenu. Another red box highlights the "Layer Loader" icon in the top right toolbar, with a red arrow pointing to it. A red callout box with the text "Pick the Layer Loader!" is positioned over the toolbar icon. The main QGIS window displays the "Layers" panel on the left and the "Browser" panel below it. On the right, a floating window titled "3DCityDB Layer Loader" is open, showing connection settings and layer management options. The status bar at the bottom shows coordinates and other metadata.

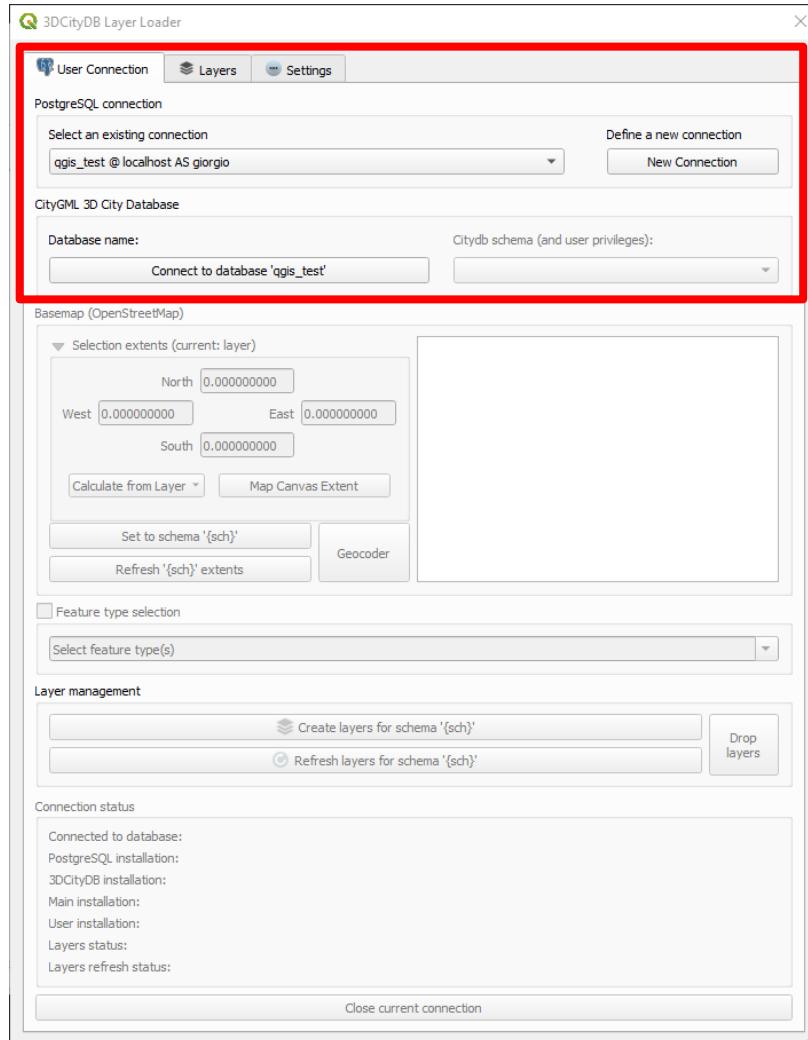

Layer Loader

In the "User Connection" tab

1) Create a new connection or use an existing one to the desired 3DCityDB instance (here: "qgis_test")

2) Use the credentials of:

- The default users **qgis_user_ro** or **qgis_user_rw** (if previously installed)
- Your own credentials (if the administrator has set up your *usr_schema* before)

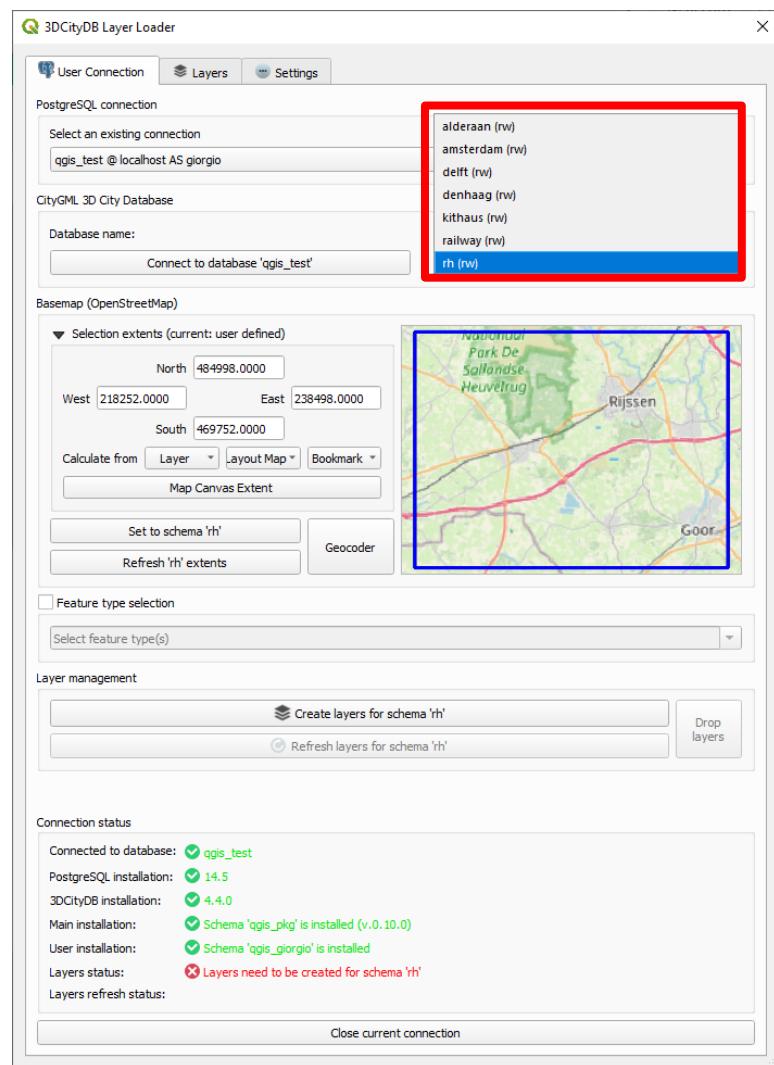

Motivation
 Plugin overview
 Software installation
Software use
 • Layer Loader
 • Bulk Deleter
 • About, etc.
 Advanced options
 Software uninstall

 QGIS Package
 Resources

Layer Loader

3) Once connected, choose one of the existing citydb schemas. If they contain CityGML data, they will be listed.
 You will also see your privileges for that citydb schema ("ro" or "rw").

Nota bene: Generally, "**citydb**" is the default, and, very often, the only one citydb schema! Nevertheless, the next slides refer to the "**rh**" schema

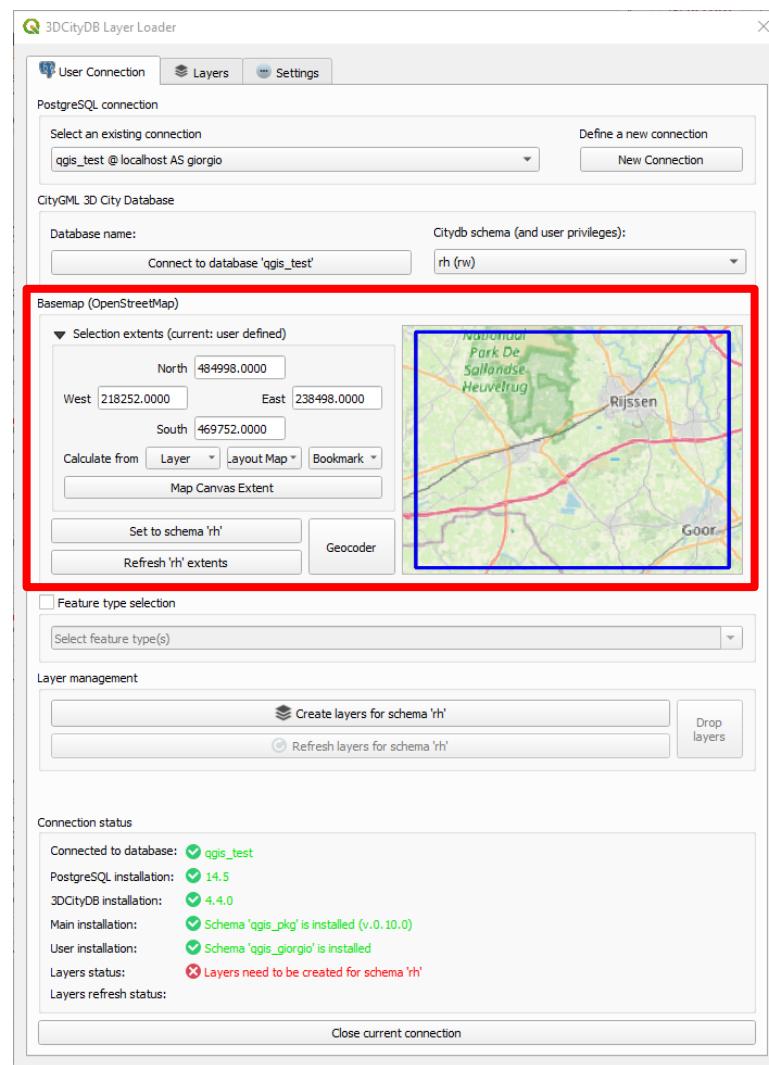

How to create additional citydb schemas
<https://3dcitydb-docs.readthedocs.io/en/latest/3dcitydb/multi-schema.html>

Layer Loader

4a) Upon selection of the citydb schema, you will see the extents of the dataset. They correspond to the extents of all currently loaded data in the selected citydb schema (here, for example, schema "rh")

Please note: the very first time you load a citydb schema, and depending on the size of the city model, it might take a while to load as the bounding boxes are being computed. From the second time onwards, it will load nearly instantly.

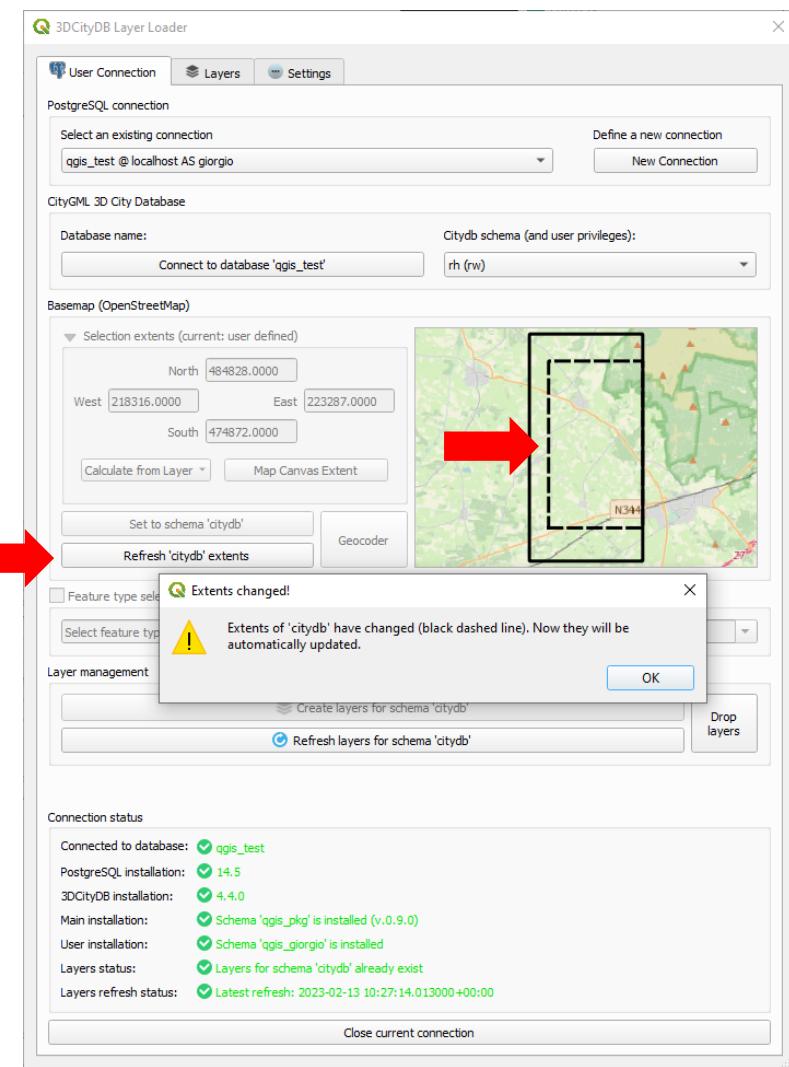

Layer Loader

4b) If data has been added or removed in the current citydb schema, you can refresh the extents by pressing the **Refresh {cdb_schema} extents** button.

The new extents will be temporarily shown with a **black dashed line**, before being updated.

Note bene: Depending on how the extents have changed, you may have to recreate, refresh and reload the layers in QGIS (see next slides)

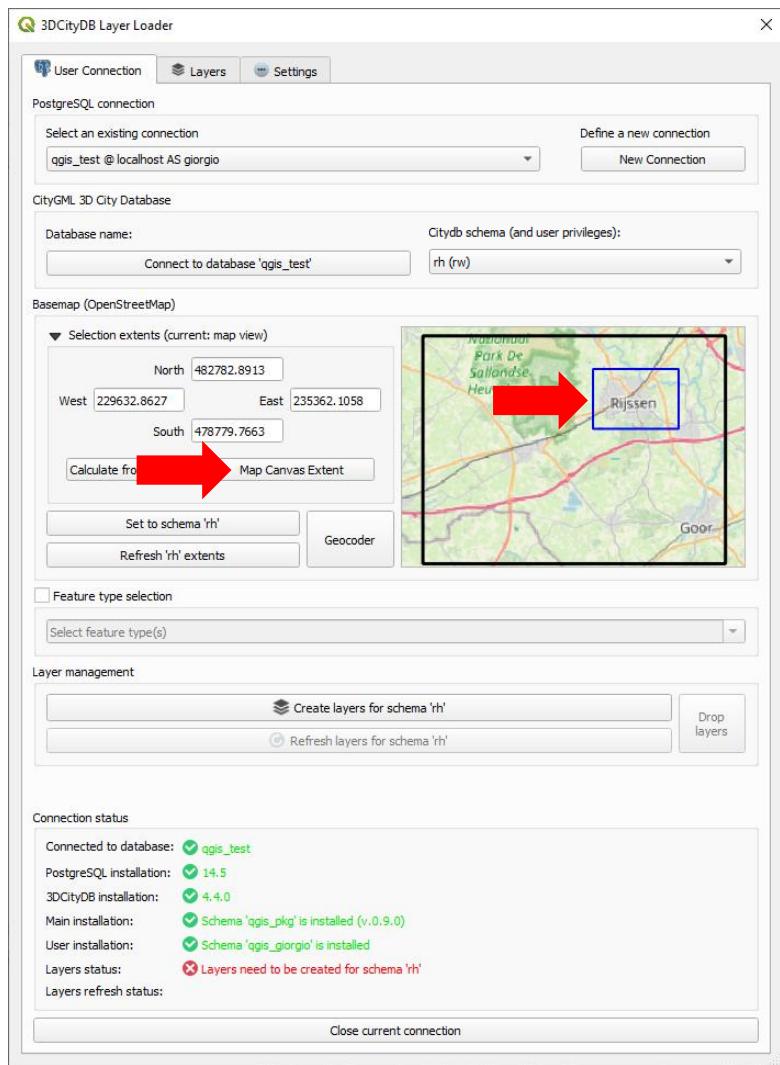

Layer Loader

5) Depending on your needs, you can set the spatial extents of the study area for which the layers will be created

- Default: same size of the whole dataset
- Otherwise: zoom in the map and choose your own area by clicking the **Map Canvas Extent button**. The **blue bounding box** shows the layers extents.

Beware: The bigger the size, the more time it will take to populate the layers!

Behind the scenes: In the database, materialised views of the geometries will be generated according to the selected extents. In case of very large cities, it might take a long time (and a lot of space on the server)!

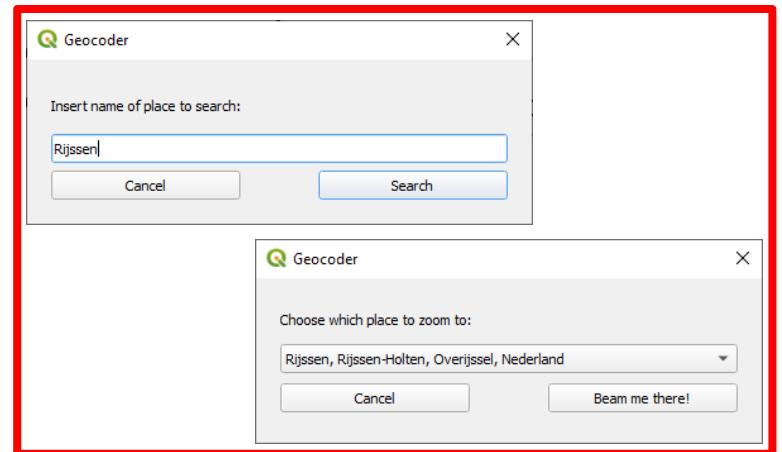

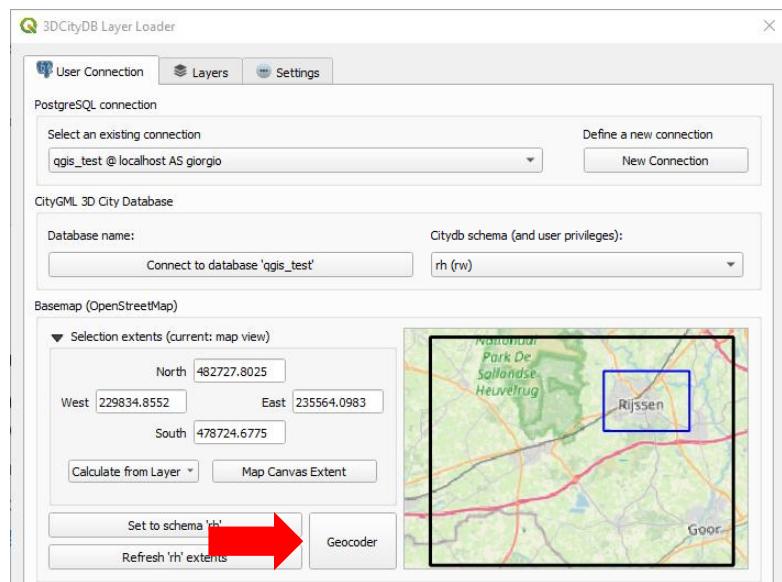

Layer Loader

5) Depending on your needs, you can set the spatial extents of the study area for which the layers will be created

- Default: same size of the whole dataset
- Otherwise: zoom in the map and choose your own area by clicking the **Map Canvas Extent button**. The **blue bounding box** shows the layers extents.

If you are looking for a specific place inside the citydb extents, you can also use the Geocoder that will zoom you directly there.

Simply click the **Geocoder button**.

Layer Loader

Black: database schema extents (i.e. extents of the whole city model/dataset)

Blue: database-side layers extents (i.e. extents of the materialised views)

12) Select the layer(s) to import into QGIS

- The number of available features is shown next to the layer name

Behind the scenes: The plugin shows only the available Layers *within* the QGIS extents (**green bounding box**).

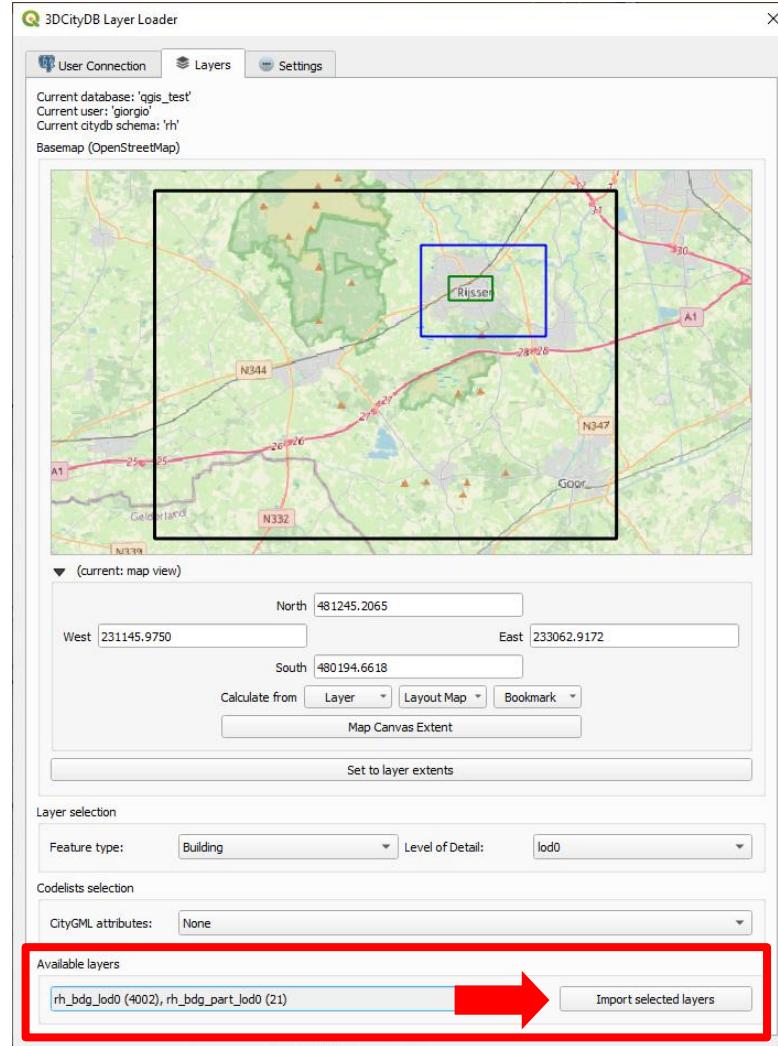

Layer Loader

13) Import the selected layers to QGIS by clicking on the **Import selected layers** button

- The import operation can be repeated with different layers
- The layers will be automatically added to the QGIS Layers Tree / Table of Contents
- The Plugin window can be closed, the connection parameters and settings will be kept until the connection is intentionally closed by the user (in the "User Connection" tab)

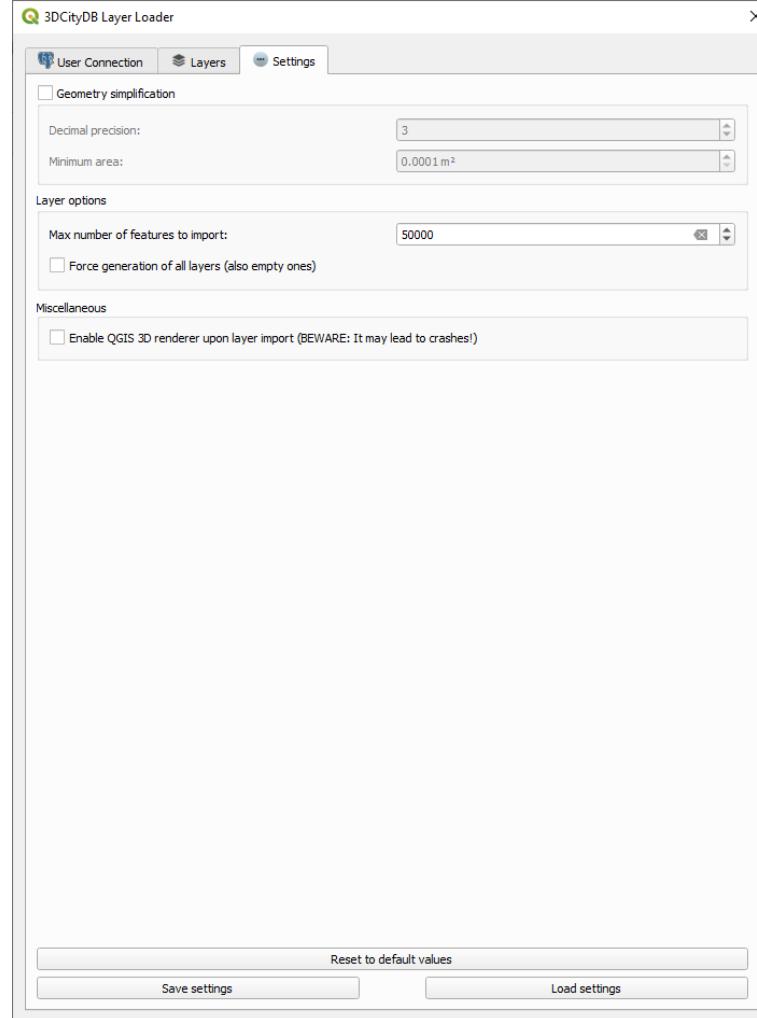

Nota bene: Layers that have already been loaded can be selected, but won't be loaded again

Layer Loader

The "Settings" tab allows to enable specific options.

- The **Geometry simplification box** contains details about the coordinates precisions and the minimum area of the geometries to be generated in the materialized views
- The **Layer options box** allows to set the maximum number of features to be imported in each import action and to force the generation of the empty layers
- In the **Miscellaneous box**, the user can force the 3D rendered to be enabled upon import of the selected layers, although this might lead to instabilities (see next slides)
- Settings can be saved, (re)loaded and reset to the default values.

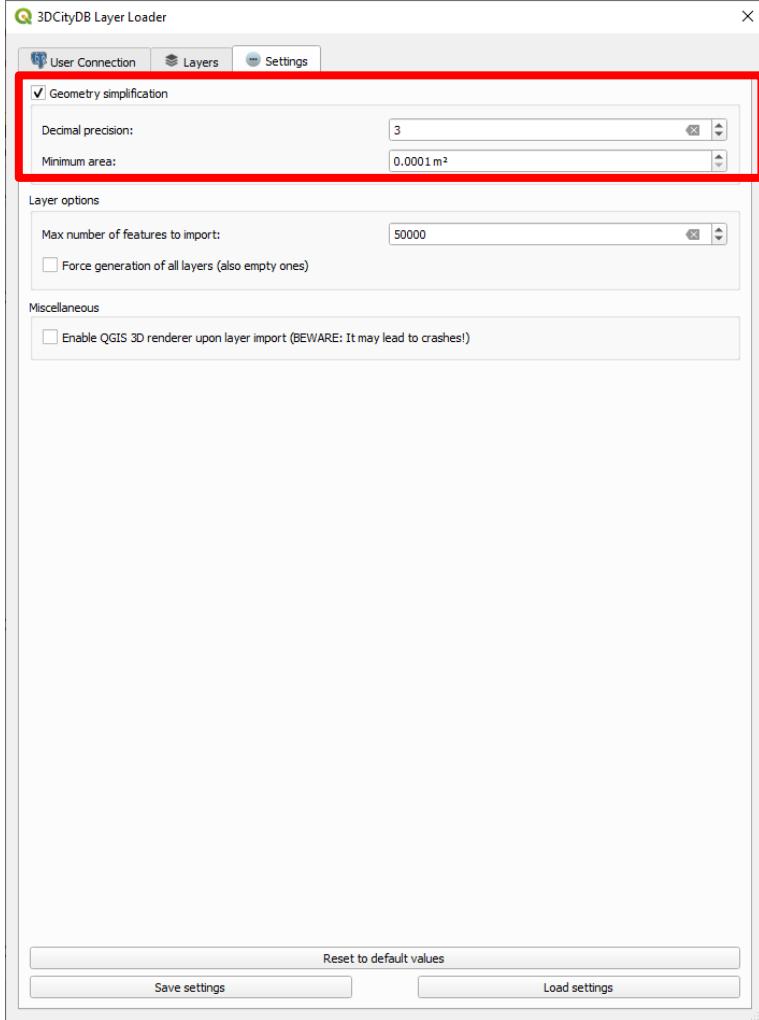

Geometry simplification

In order to simplify geometries and (partially) cope with the 3D visualisation issues of the 3D View Map in QGIS, the user can set some simplification parameters *before* generating the layers.

All polygons composing the geometries will be checked. The user can set the number of decimal positions in the coordinates. Resulting degenerate geometries are filtered out. The second parameter filters out all polygons smaller than the chosen threshold.

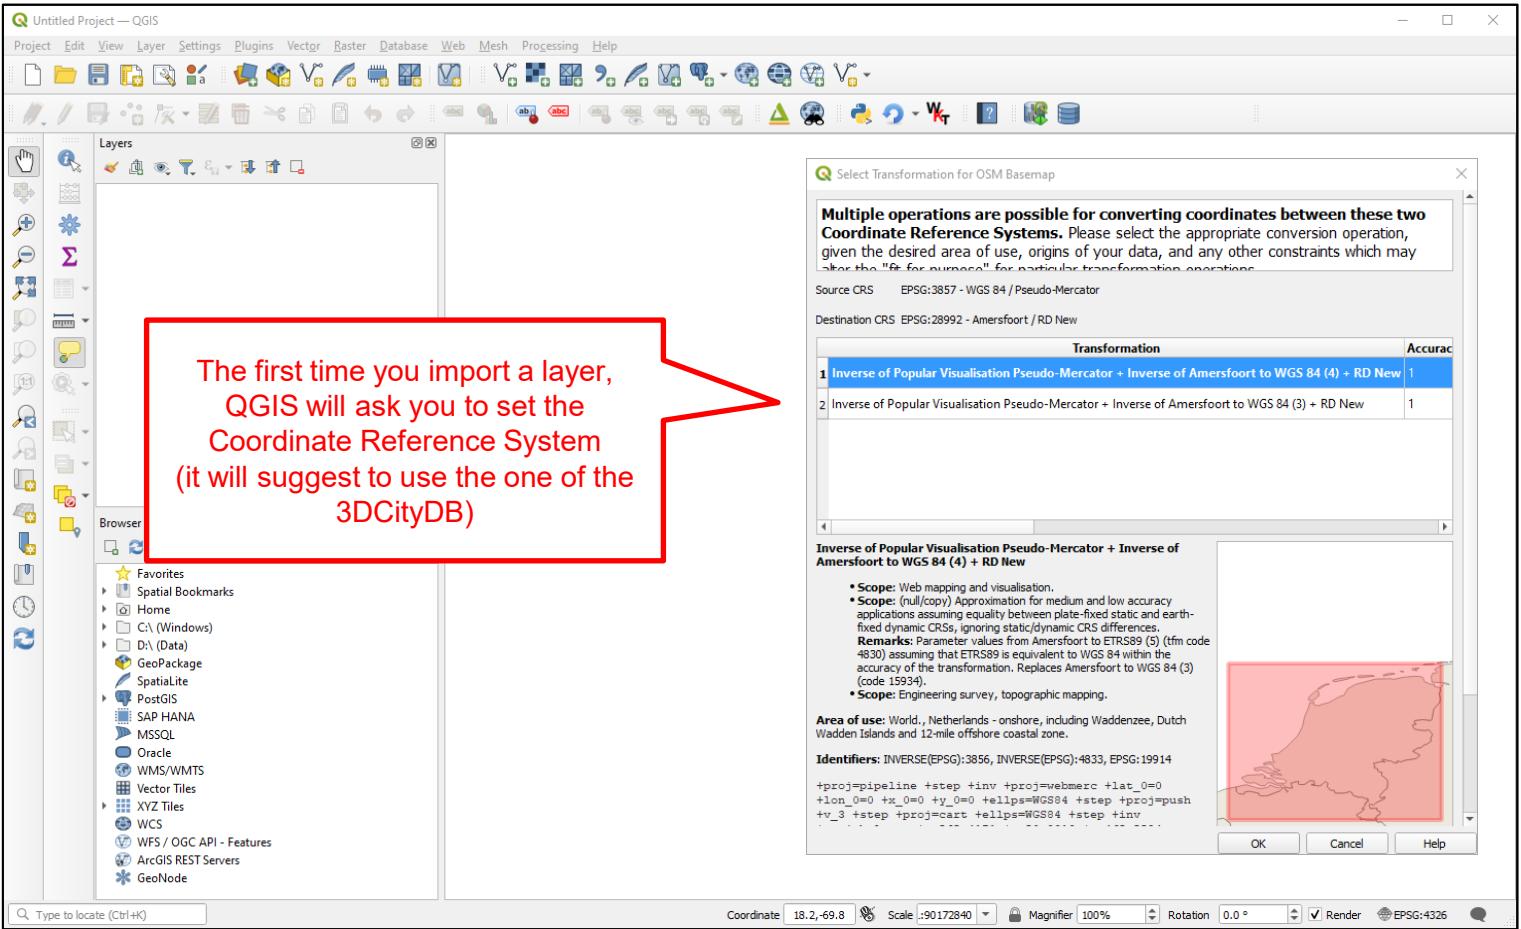

Beware! This operation:

- can significantly increase the time needed to refresh the layers
- does NOT change the original data in the database!

The screenshot shows the QGIS interface with a map view and a table view. The map view displays several red building footprints and a single yellow polygon representing vegetation. A callout box highlights the table view, which lists five building features with their IDs, GML IDs, names, and creation dates. The table view also includes columns for GML codespace, Name codespace, Description, Termination Date, Relative to Terrain, and Relation.

ID	GML ID	GML codespace	Name	Name codespace	Description	Creation Date	Termination Date	Relative to Terrain	Relation
1	596622	NL.1MBAG.Pan...	3dbag_v210908..	Building 4905-52	NULL	NULL	10-05-2022 10:2...	NULL	(City)Object en...

Attributes are grouped into tabs.

The screenshot shows the QGIS Attribute Editor for a feature named "Building 4906-2911". The top section, titled "rh_bdg_lod0 - Feature Attributes", contains several tabs: "Main Info", "Database Info", "Relation to surface", "Ext ref (Name)", "Ext ref (Uri)", and "Addresses". A red box highlights the first three tabs. Below these tabs, there are fields for Database ID (524581), GML ID (NL.IMGAG.Pand.1742100000023595), Description (NULL), GML codespace (R-Buildings 2022-11-07.zip), Name (Building 4906-2911), and Name codespace (NULL).

The middle section, titled "Gen Attrib (String)", displays an expression builder with three items: "3dbag_tile", "building_type", and "dutch_building_type". It also shows a preview of the "3dbag_tile" attribute with Database ID 2829415, Attribute name 3dbag_tile, and Value 3dbag_v210908_fd2cee53_4906.

The bottom section, titled "Feature-specific attributes", lists various properties:

- Year of construction: 2010
- Storeys above ground: 5
- Height: 30.535
- Storey height above ground: NULL
- Storey height below ground: NULL
- Roof type: multiple horizontal
- Year of demolition: NULL
- Storeys below ground: 0
- Height: UoM m
- Storey height above ground: UoM NULL
- Storey height below ground: UoM NULL
- Roof type: Codespace NULL

At the bottom right are "OK" and "Cancel" buttons.

Use in QGIS: Attributes

The screenshot shows the QGIS Attribute Editor for a feature named "Building 4906-2911". The top part displays "Feature Attributes" with tabs for Main Info, Database Info, and Relation to surface. The Main Info tab shows Database ID 524581, GML ID NL.IMBAG.Pand.1742100000023, and Name Building 4906-2911. A red box highlights the text "Related data can be viewed either in form or in table mode" with an arrow pointing to the bottom part of the interface.

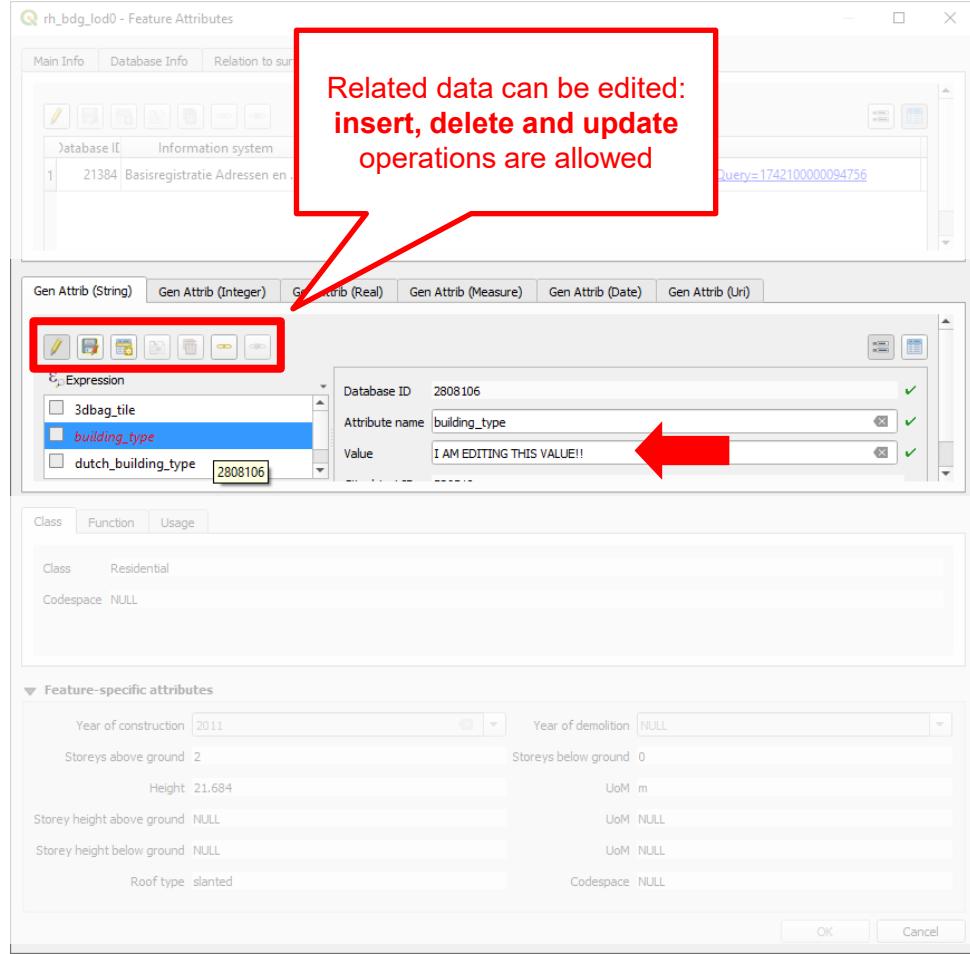

The bottom part of the editor shows a table with the following data:

	Database ID	Attribute name	Value	Cityobject ID
1	2829415	3dbag_tile	3dbag_v210908... fd2cee53_4906	524581
2	2829427	pand_id	1742100000023...	524581
3	2829466	building_type	MFH	524581

Two icons in the bottom right corner of the table view are highlighted with red boxes: a grid icon and a table icon.

Use in QGIS: Attributes

The screenshot shows the QGIS Attribute Editor for a feature named "Building 4906-2911". The "Main Info" tab is selected, displaying basic information such as Database ID (524581), GML ID (NL.IMBAG.Pand.1742100000023595), Description (NULL), and Name (Building 4906-2911). Below this, the "Feature-specific attributes" tab is shown, which contains detailed building characteristics:

Attribute	Value
Year of construction	2010
Storeys above ground	5
Height	30.535
Storey height above ground	NULL
Storey height below ground	NULL
Roof type	multiple horizontal
Codespace	NULL

A red box highlights the "Feature-specific attributes" tab, and a red arrow points from the text "Feature-specific attributes are grouped in the lower part of the form." to this tab.

If the user has read/write privileges, most attributes can be edited. (Whole) features can also be completely deleted. Edits will be saved *directly* to the database.

If the user has read-only privileges, the edit button will be grayed out, i.e. no edits are allowed.

The 'Feature Attributes' dialog shows the following fields:

Attribute	Value
3dbag_tile	2829415
building_type	3dbag_v_210908_fd2cee53_4906
dutch_building_type	

Feature-specific attributes (values shown in the screenshot):

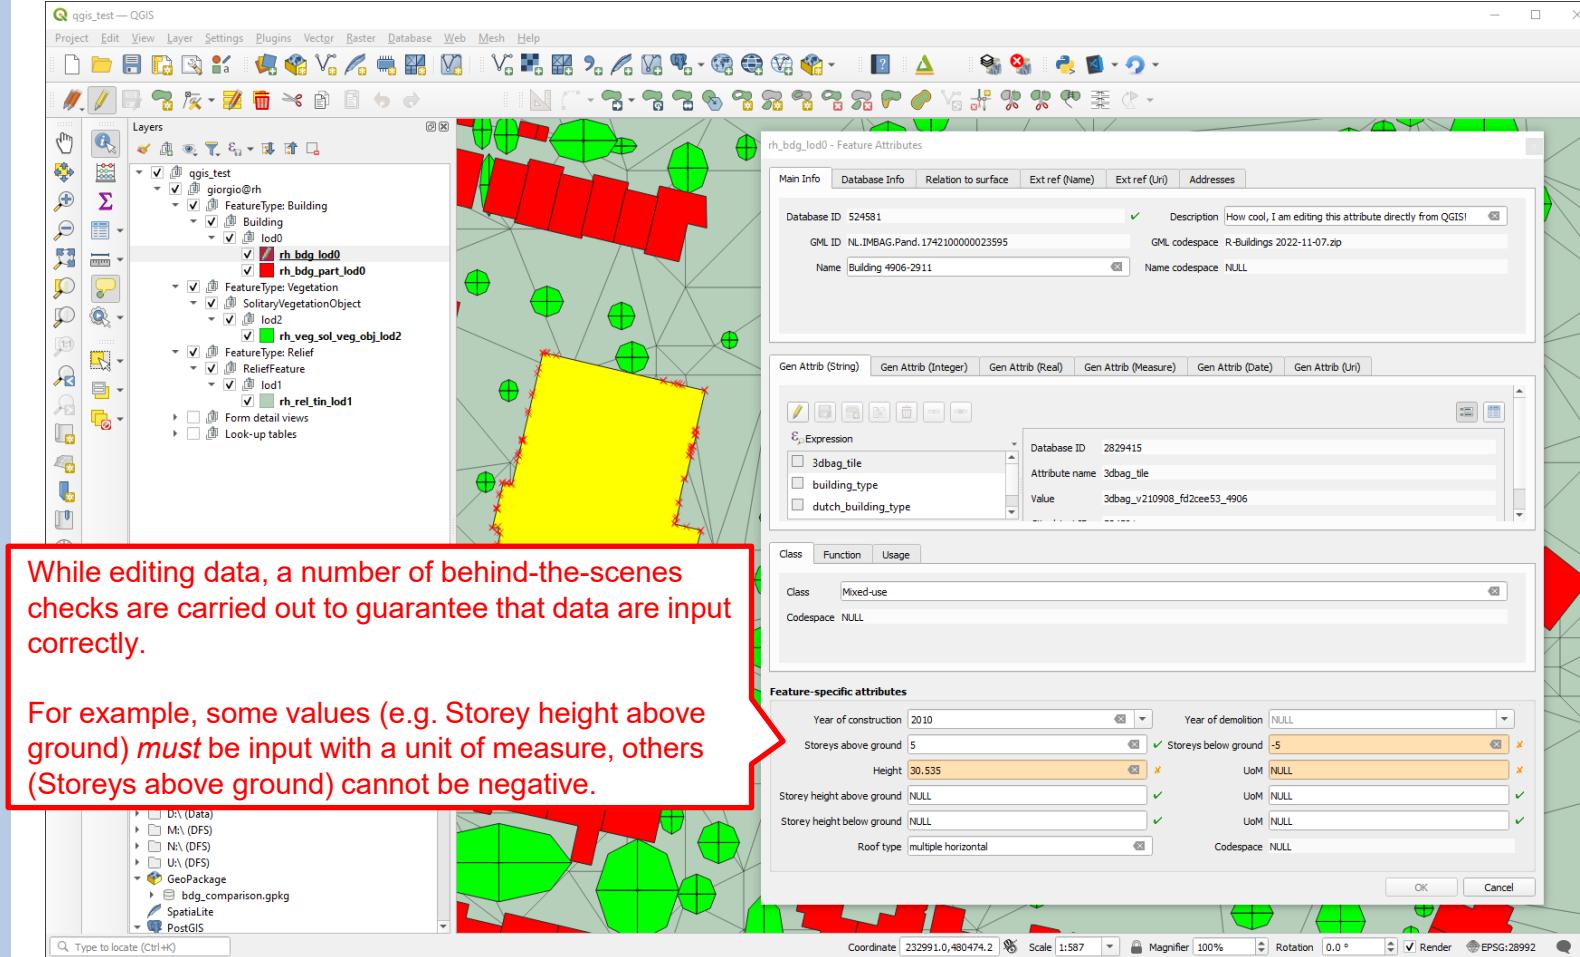

Attribute	Value
Year of construction	2010
Storeys above ground	5
Height	30.535
Storey height above ground	NULL
Storey height below ground	NULL
Roof type	multiple horizontal
Year of demolition	NULL
Storeys below ground	0
UoM	m
UoM	NULL
UoM	NULL
Codespace	NULL

While editing data, a number of behind-the-scenes checks are carried out to guarantee that data are input correctly.

For example, some values (e.g. Storey height above ground) *must* be input with a unit of measure, others (Storeys above ground) cannot be negative.

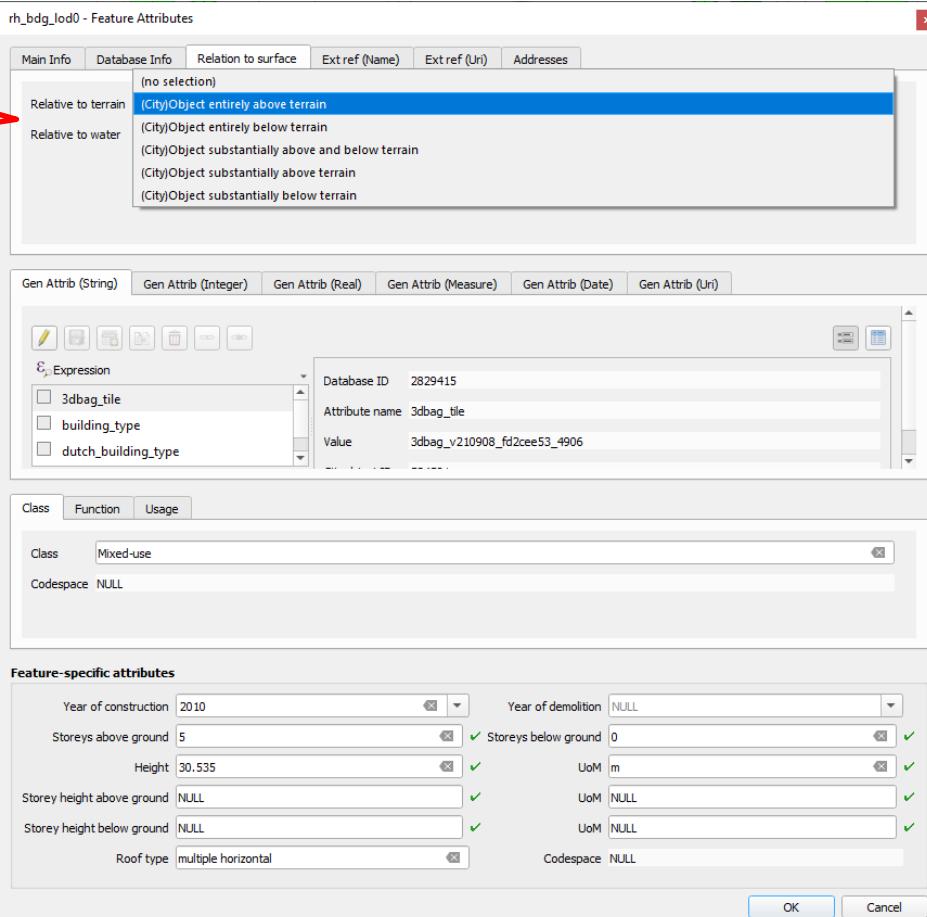

The screenshot shows the QGIS interface with a map view displaying buildings and vegetation. The 'Layers' panel on the left shows a tree structure of layers, with 'rh_bdg_lod0' selected. The 'Attribute Attributes' dialog is open for this layer, showing fields like 'Database ID' (524581), 'GML ID' (NL.IMGAG.Pand.1742100000023595), and 'Name' (Building 4906-2911). The 'Feature-specific attributes' section contains fields for 'Year of construction' (2010), 'Storeys above ground' (5), 'Height' (30.535), and 'UoM' (NULL). A red callout box points to the 'Height' field, which is highlighted in orange, indicating it must have a unit of measure.

In our tests, such artefacts are a 3D visualisation issue (QGIS 3D renderer?) and *not* related to the actual data. 3D visualisation in FME and in Google Earth shows indeed correct results.

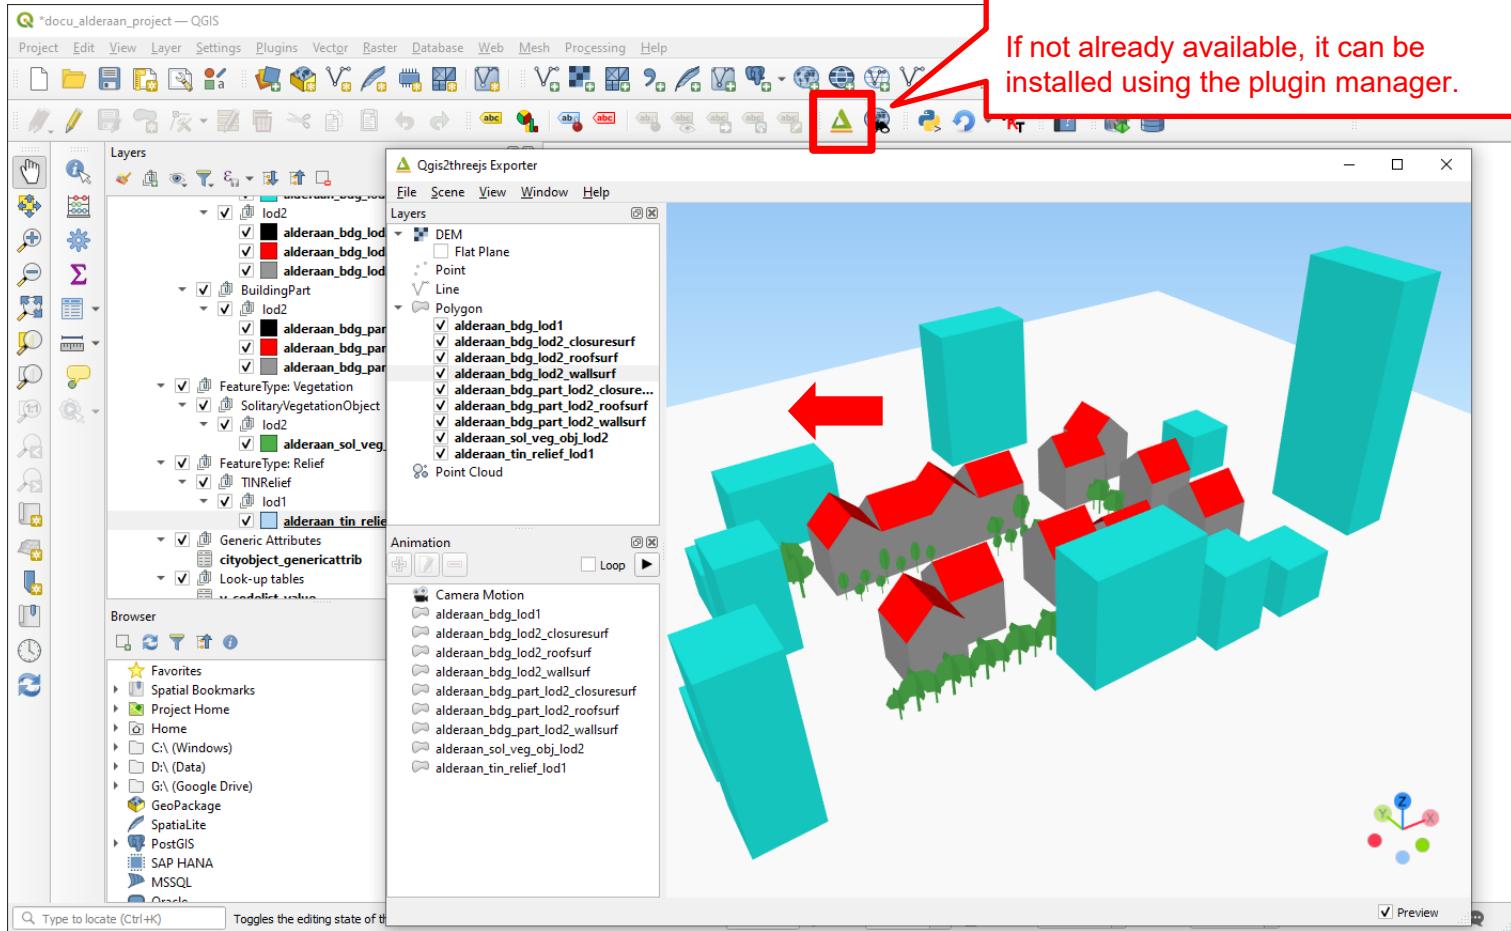

✓
Google
earth
(as KML)

Use in QGIS: 3D visualisation

Alternatively, the **Qgis2threejs** plugin can be used for 3D visualisation.

If not already available, it can be installed using the plugin manager.

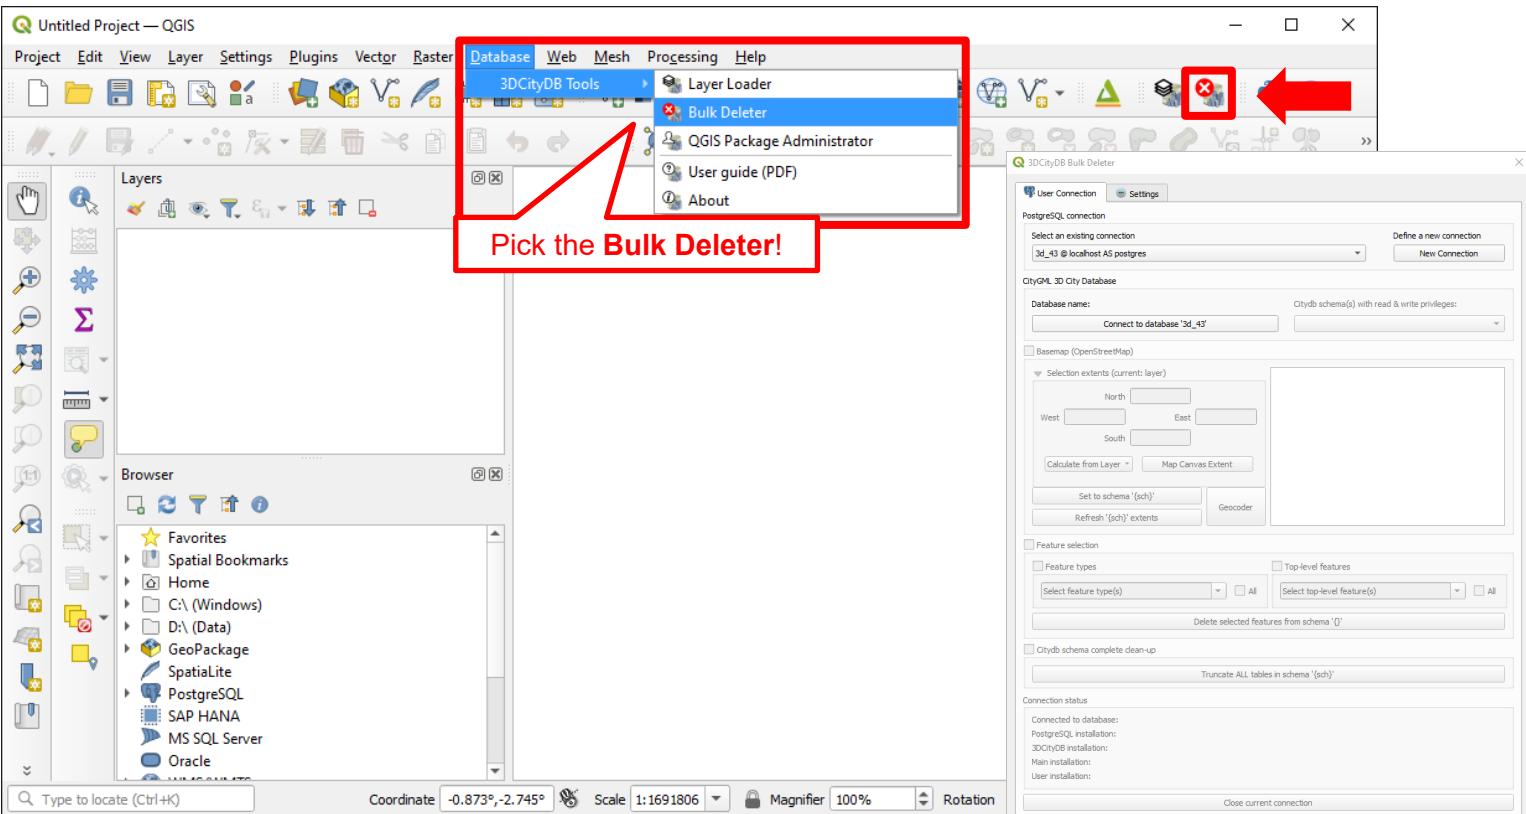

Bulk Deleter

Open the **Bulk Deleter** from the menu or by clicking on the corresponding icon

- Motivation
- Plugin overview
- Software installation
- Software use**
 - Layer Loader
 - Bulk Deleter
 - About, etc.
- Advanced options
- Software uninstall
- Current limitations
- QGIS Package

Bulk Deleter

In the "User Connection" tab

1) Create a new connection or use an existing one to the desired 3DCityDB instance (here: "qgis_test")

2) Connect to the chosen database

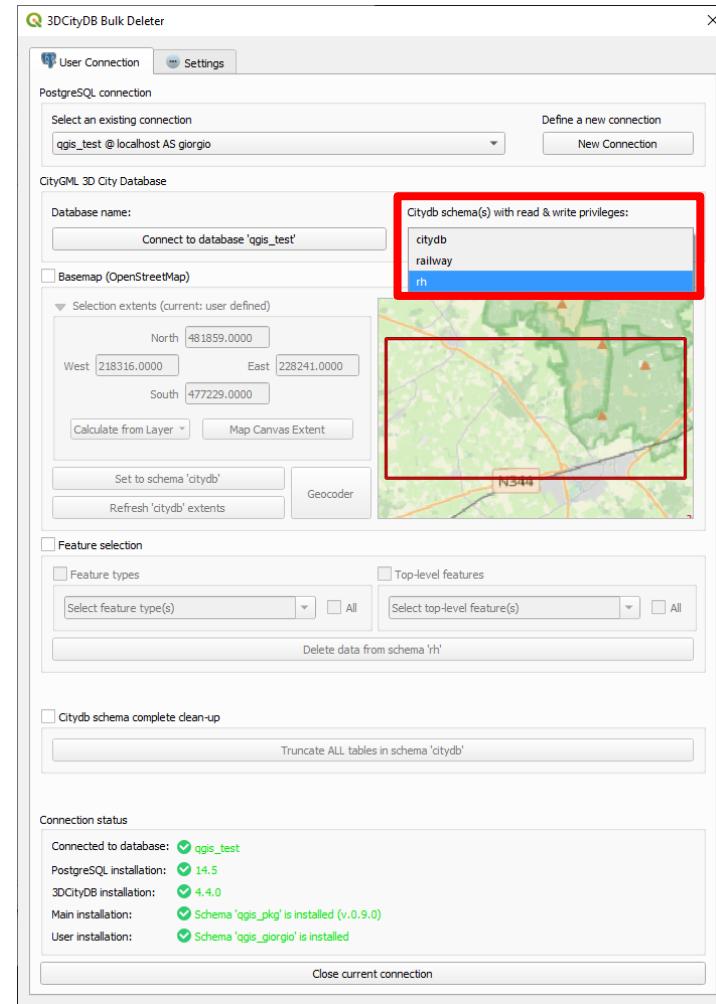

Bulk Deleter

3) Once connected, choose one of the available citydb schemas

Nota bene: Only the citydb schemas for **which you have read & write ("rw") privileges** are listed

- Motivation
- Plugin overview
- Software installation
- Software use**
 - Layer Loader
 - Bulk Deleter
 - About, etc.
- Advanced options
- Software uninstall
- Current limitations
- QGIS Package
- Resources

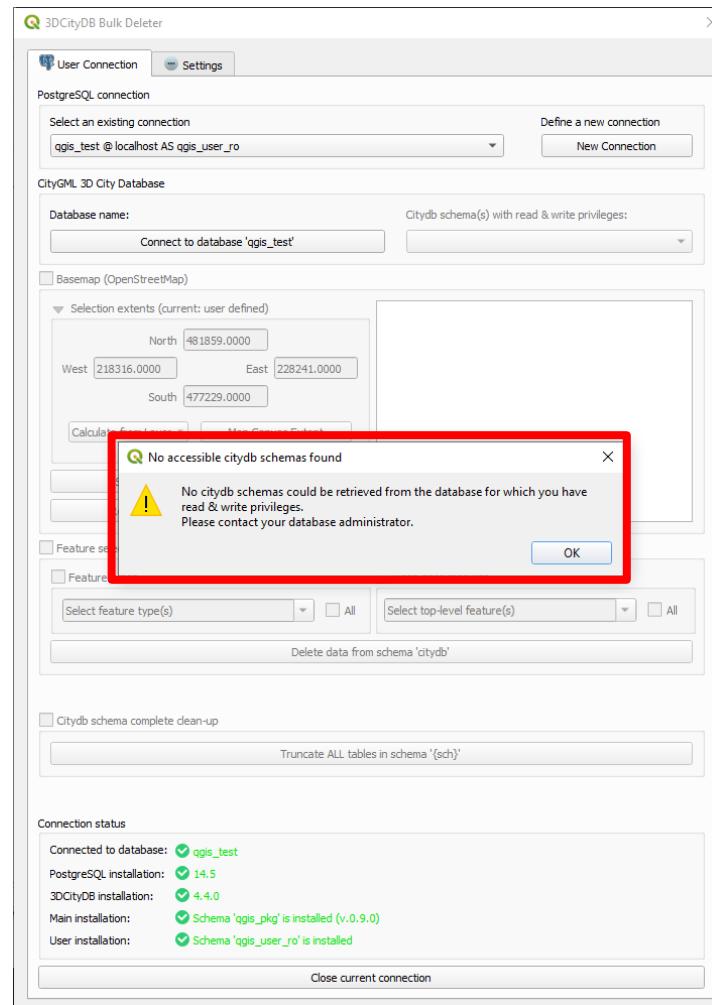

Bulk Deleter

3) Once connected, choose one of the available citydb schemas

Nota bene: Only the citydb schemas for which you have read & write ("rw") privileges are listed

If there are no citydb schemas for which you have "rw" privileges, you will be notified before the connection is closed and the GUI completely disabled.

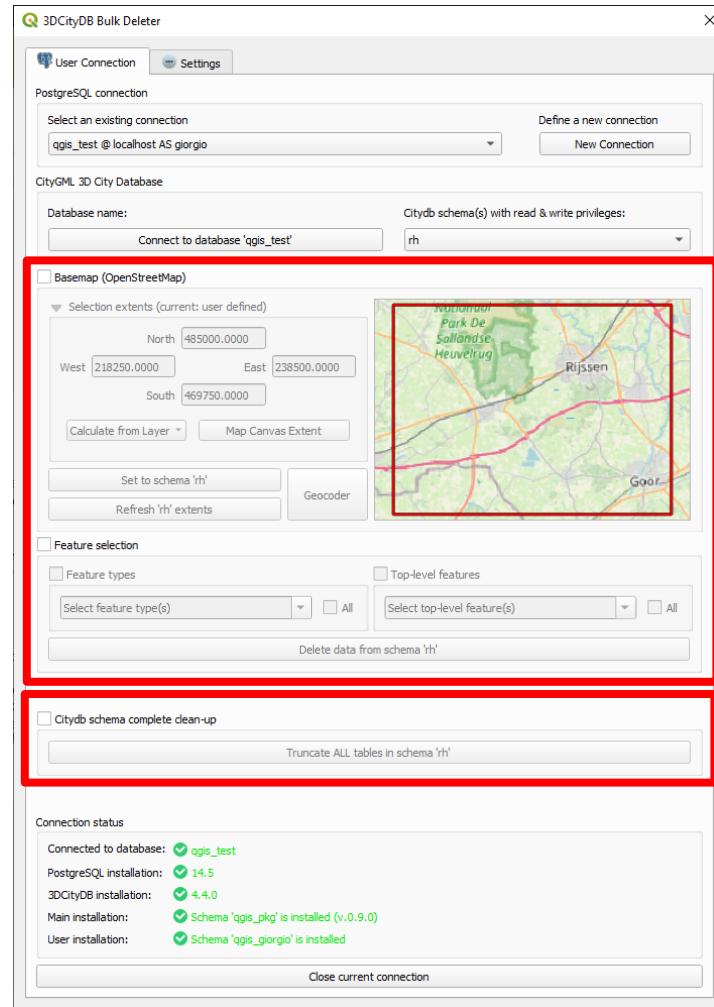

Bulk Deleter

4) Once you have selected the citydb schema, you can perform 2 types of actions:

- Select specific features to delete (and optionally define a spatial filter, too)
- Clean up the whole schema, i.e. truncate all tables of the selected citydb schema

The GUI will prevent you from choosing both at the same time

Bulk Deleter

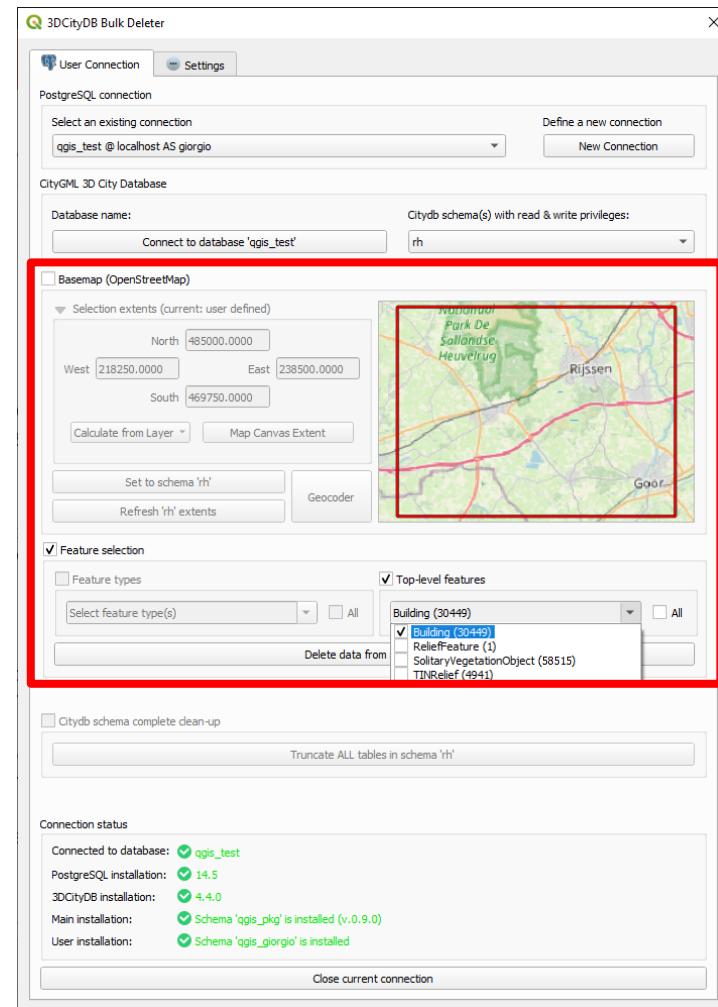

Motivation
 Plugin overview
 Software installation
Software use
 • Layer Loader
 • Bulk Deleter
 • About, etc.
 Advanced options
 Software uninstall
 Current limitations
 QGIS Package
 Resources

5a) Select the features to delete. Activate the **Feature selection box**. You can now select:

- either CityGML Features types
- or top-level features

Remember: Feature Types correspond to CityGML modules, i.e. they may contain multiple top-level features. For example:

- Feature Type "Vegetation" includes "Solitary Vegetation Object" and "PlantCover" top-level features
- Feature Type "Relief" includes "TINRelief", "BreakLineRelief" and "MassPointRelief" top-level features

Bulk Deleter

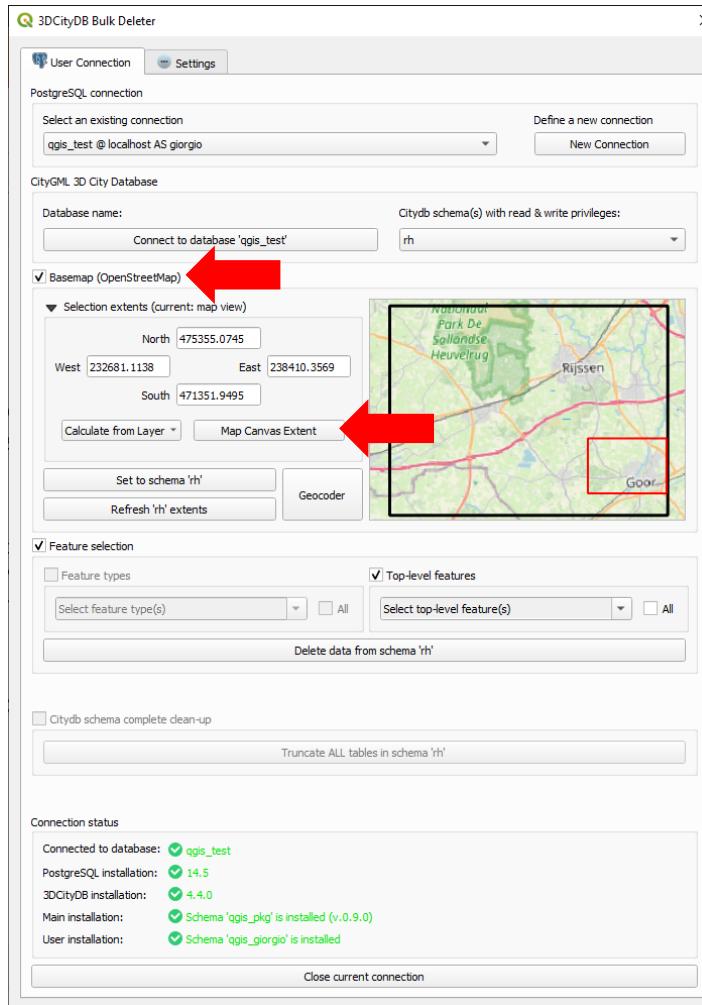

- Motivation
- Plugin overview
- Software installation
- Software use**
 - Layer Loader
 - Bulk Deleter
 - About, etc.
- Advanced options
- Software uninstall
- Current limitations
- QGIS Package
- Resources

5a) Select the features to delete. Activate the **Feature selection box**. You can now select:

- either CityGML Features types
- or top-level features
- and, optionally, define the extents of the area where to delete the selected feature. You must then also activate the **Basemap box** and press the **Map Canvas Extent button**

The delete extents are represented by the **red bounding box**.

Please note: The Set to schema {cdb_schema}, Refresh {cdb_schema} and GeoCoder buttons follow the same logic as in the Layer Loader

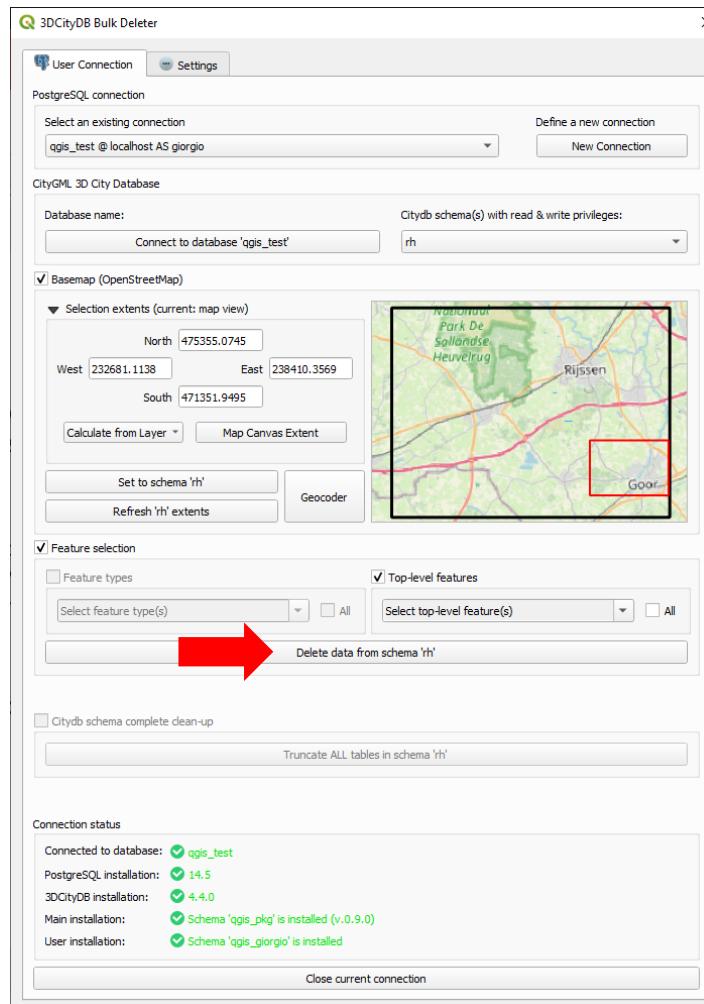

Bulk Deleter

- Motivation
- Plugin overview
- Software installation
- Software use**
 - Layer Loader
 - Bulk Deleter
 - About, etc.
- Advanced options
- Software uninstall
- Current limitations
- QGIS Package
- Resources

6a) Press the **Delete data from schema {cdb_schema}** button

Beware: Depending on the quantity of selected features, the operation might take some time.

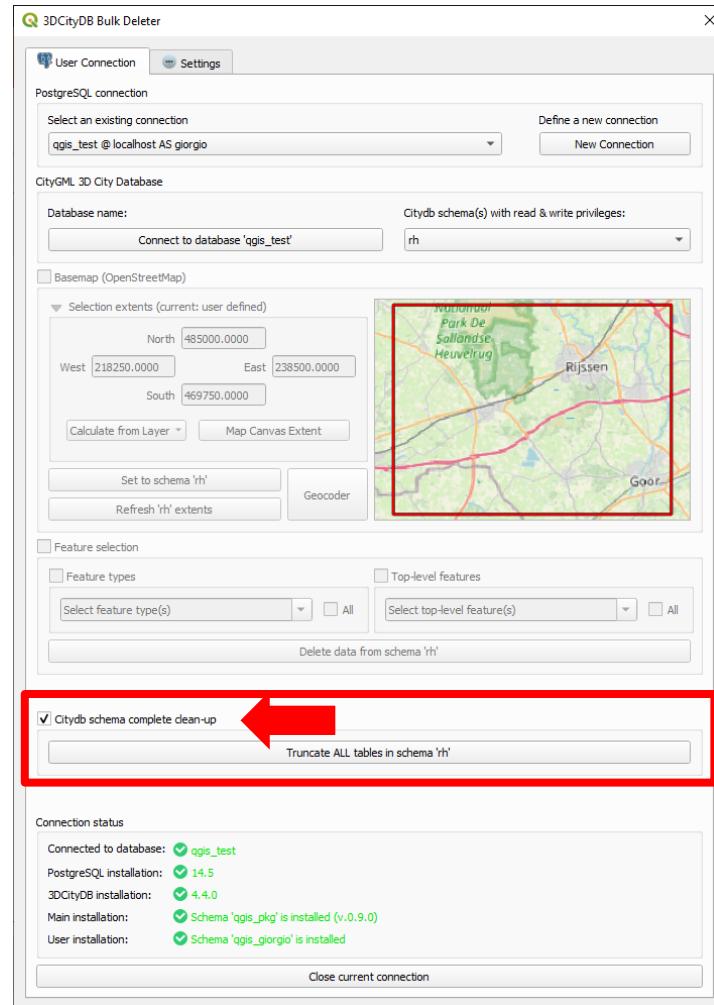

If you want to completely delete the database, you are recommended to use the other option (see next slides) which is **much faster!**

Bulk Deleter

5b) Enable the **Citydb schema complete clean-up box** and press the **Truncate ALL tables in schema {cdb_schema}** button.

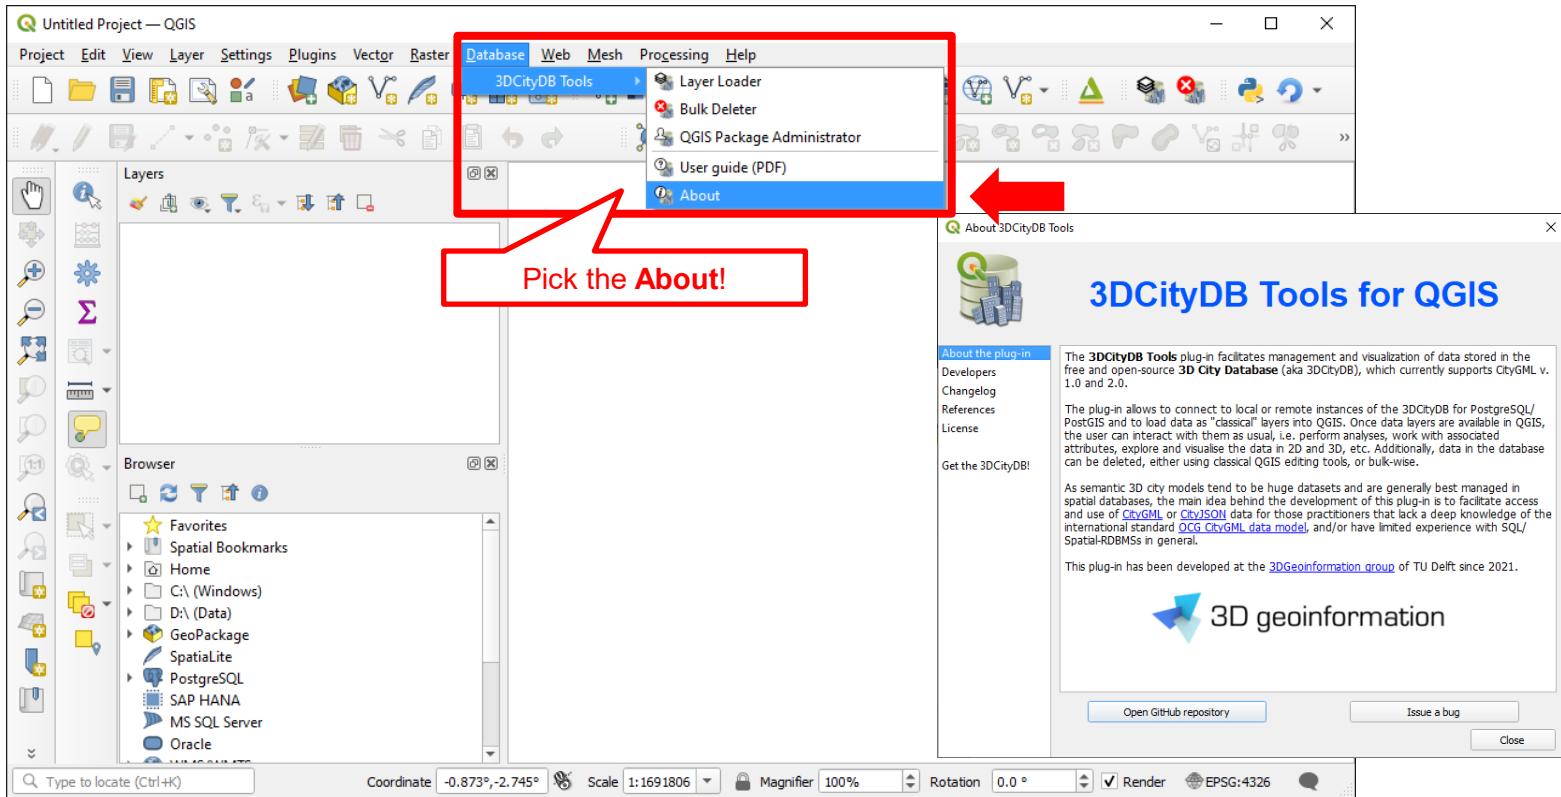

Beware: The selected citydb schema will be completely emptied and reset to its initial state. In addition, all preexisting privileges (also of other users) will be reset to "None"

About

The **About** dialog provides additional information about the plug-in, the possibility to access the GitHub repository (and submit a bug), or to get the 3DCityDB Suite

Customised codelists

For certain CityGML properties (e.g. class, function, usage, roof type, etc.) the QGIS attribute forms in the Layer Loader can be linked to look-up tables containing

- Codelist values from the non-normative CityGML specifications
- Codelist values optionally defined by the user

This applies to properties containing single (e.g. class, roof type) or, possibly, multiple values (e.g. function, usage)

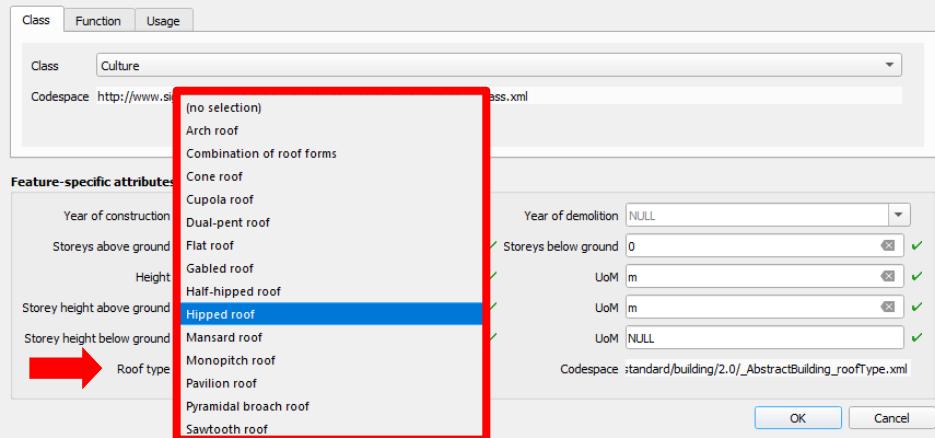

In this way the user does not have to "remember" specific codes when typing, thus reducing the chances of wrong data input

The 3DCityDB-Tools plugin already contains the codelists from the CityGML 2.0 specifications.

 Resources

Property with cardinality [0..1]:
 drop-down list

Property with cardinality [0..*]:
 multiple-selection list

Customised codelists

Adding customised codelists requires **two steps**:

- 1) Load the actual codelist data** (codelist entries and codelist metadata). Such data must be stored in two predefined tables of the QGIS Package in the 3DCityDB
- 2) Add mapping rules** for automatic setup of the lists in the attribute forms. Such data must be stored in a predefined table of the QGIS Package in the 3DCityDB

Both operations can be carried out either by the database administrator or by the user

1) Administrator:

- The predefined tables are in schema **qgis_pkg**
- All codelists and rules are made available to each newly created `qgis_{usr}` schema

2) User:

- The predefined tables are in schema **qgis_{usr_name}**
- All codelists and rules are available only to user

Customised codelists

Adding customised codelists requires **two steps**:

1) Load the actual codelist data (codelist entries and codelist metadata). Such data must be stored in two predefined tables of the QGIS Package in the 3DCityDB

- The tables are named **CODELIST** and **CODELIST_VALUE** in the `qgis_{usr_name}` and **CODELIST_TEMPLATE** and **CODELIST_VALUE_TEMPLATE** in the `qgis_pkg` schema, respectively. Their structure is exactly the same
- The following examples are based on tables CODELIST and CODELIST_VALUE but the procedure is the same for the *_TEMPLATE ones

Customised codelists

To add values to the **CODELIST** and **CODELIST_VALUE** tables, the user can for example issue a SQL statement such as:

```
-- Optionally, delete previously loaded values belonging to the same codelist in user schema "qgis_giorgio"  
DELETE FROM qgis_giorgio.codelist WHERE data_model = 'NL-BAG';  
-- Insert first the codelist metadata and then the values in one single SQL statement  
WITH cl AS (  
    INSERT INTO qgis_giorgio.codelist (data_model, name, name_space, description)  
    VALUES  
    ('NL-BAG', 'BAG', 'https://..some_url_here....', 'Codelist containing the values of the Dutch Basisregistratie  
    Adressen en Gebouwen')  
    RETURNING id)  
INSERT INTO qgis_giorgio.codelist_value (code_id, value, description)  
SELECT cl.id, v.value, v.description FROM cl, (VALUES  
    ('apple' , 'Codelist value for "apple"'),  
    ('orange' , 'Codelist value for "orange"'),  
    ('pear' , 'Codelist value for "pear"'),  
    ('banana' , 'Codelist value for "banana"')  
) AS v(value, description);
```

This SQL statement can be adapted by changing only the parts in red

Customised codelists

Adding customised codelists requires **two steps**:

- 1) Load the actual codelist data (codelist entries and codelist metadata). Such data must be stored in two predefined tables of the QGIS Package in the 3DCityDB
- 2) **Add mapping rules** for automatic setup of the lists in the attribute forms. Such data must be stored in a predefined table of the QGIS Package in the 3DCityDB
 - The table is named **CODELIST_LOOKUP_CONFIG** in the `qgis_{usr_name}` and **CODELIST_LOOKUP_CONFIG_TEMPLATE** in the `qgis_pkg` schema, respectively. Their structure is exactly the same
 - The following examples are based on tables `CODELIST_LOOKUP_CONFIG` but the procedure is the same for the `*_TEMPLATE` one

Customised codelists

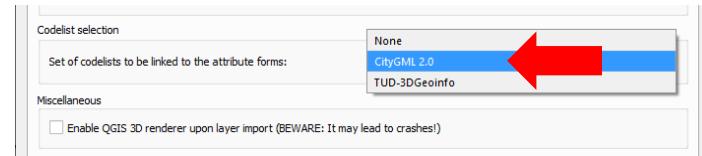

Tables (8)	
>	codelist
>	codelist_lookup_config
>	codelist_value
>	enumeration
>	enumeration_value
>	extents
>	layer_metadata
>	settings

Table **CODELIST_LOOKUP_CONFIG** contains fields used to map Codelist values to the corresponding form attributes in QGIS.
Explanation of the necessary fields is given in the next slide.

id [PK] integer	name character varying	ade_prefix character var	source_class character varying	source_table character varying	source_column character varying	target_table character varying	key_column character var	value_column character varyir	filter_expression character varying
1	CityGML 2.0	[null]	Bridge	bridge	class	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeClass'
2	CityGML 2.0	[null]	Bridge	bridge	function	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'
3	CityGML 2.0	[null]	Bridge	bridge	usage	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'

18	CityGML 2.0	[null]	BuildingFurnit...	building_furnit...	class	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = 'BuildingFurnitureClass'
19	CityGML 2.0	[null]	BuildingFurnit...	building_furnit...	function	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = 'BuildingFurnitureFunctionUsage'
20	CityGML 2.0	[null]	BuildingFurnit...	building_furnit...	usage	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = 'BuildingFurnitureFunctionUsage'

Customised codelists

Those in yellow are the fields the must be added by the user. The other ones will be added automatically

NAME: The name indicating the set of mapping rules. It must be the same for all rules belonging to the same group. This label will be the selectable one in the QGIS GUI.

SOURCE_CLASS: The CityGML/ADE* class the CodeList will be associated to (*ADEs are currently not supported)

SOURCE_TABLE: The corresponding citydb table which contains the column to be associated to a codelist

SOURCE_COLUMN: The column to be associated to a codelist

ALLOW_MULTI: FALSE if the cardinality is 0..1, TRUE if it is 0..*

NUM_COLUMNS: Number of column presented in the widget and containing look-up values. Default: 1 when ALLOW_MULTI is FALSE, 3 when ALLOW_MULTI is TRUE.

FILTER_EXPRESSION: String containing the expression to filter the values of the desired codelist in the GUI form. It refers to the values of the columns DATA_MODEL and NAME of view V_CODELIST (see previous slides).

integer	name character varying	ade_prefix character var	source_class character varying	source_table character varying	source_colur character var	target_table character var	key_column character var	value_column character var	filter_expression character varying	num_columns integer	allow_multi boolean	allow_null boolean	order_by_value boolean	use_comp boolean
1	CityGML 2.0	[null]	Bridge	bridge	class	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeClass'	1	false	true	true	false
2	CityGML 2.0	[null]	Bridge	bridge	function	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'	3	true	true	true	false
3	CityGML 2.0	[null]	Bridge	bridge	usage	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'	3	true	true	true	false
4	CityGML 2.0	[null]	BridgePart	bridge	class	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeClass'	1	false	true	true	false
5	CityGML 2.0	[null]	BridgePart	bridge	function	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'	3	true	true	true	false
6	CityGML 2.0	[null]	BridgePart	bridge	usage	v_codelist	value	description	data_model = 'CityGML 2.0' AND name = '_AbstractBridgeFunctionUsage'	3	true	true	true	false

Codelists and look-up tables

To add values to the **CODELIST_LOOKUP_CONFIG** table, the user can for example issue a SQL statement such as:

```
-- Optionally, delete previously loaded values belonging to the same codelist group in user schema "qgis_giorgio"  
DELETE FROM qgis_giorgio.codelist_lookup_config WHERE name = 'StarWarsCodelist';  
-- Insert the mapping rules in one single SQL statement  
INSERT INTO qgis_giorgio.codelist_lookup_config  
(name, source_class, source_table, source_column, allow_multi, num_columns, filter_expression)  
VALUES  
('StarWarsCodelist', 'Building' , 'building', 'class' , FALSE, 1, 'data_model = "StarWarsCoruscant" AND name =  
"CoruscantBdgClass"),  
('StarWarsCodelist', 'Building' , 'building', 'function' , TRUE , 3, 'data_model = "StarWarsCoruscant" AND name =  
"CoruscantBdgFunction"),  
('StarWarsCodelist', 'Building' , 'building', 'usage' , TRUE , 3, 'data_model = "StarWarsCoruscant" AND name =  
"CoruscantBdgUsage"),  
('StarWarsCodelist', 'Building' , 'building', 'roof_type' , FALSE, 1, 'data_model = "StarWarsCoruscant" AND name =  
"CoruscantBdgRoofType");
```

This SQL statement can be adapted by changing only the parts in red. For the qgis_pkg, use table CODELIST_LOOKUP_CONFIG_TEMPLATE instead.

Software uninstall

Uninstallation consists of two parts:

1) Partial/complete **removal of the QGIS Package** from PostgreSQL

- This operation can be carried out only by the database administrator
- The administrator can choose to drop only the schema of a selected user (e.g. "qgis_giorgio")
- The administrator can remove all user schemas AND the qgis_pkg schema

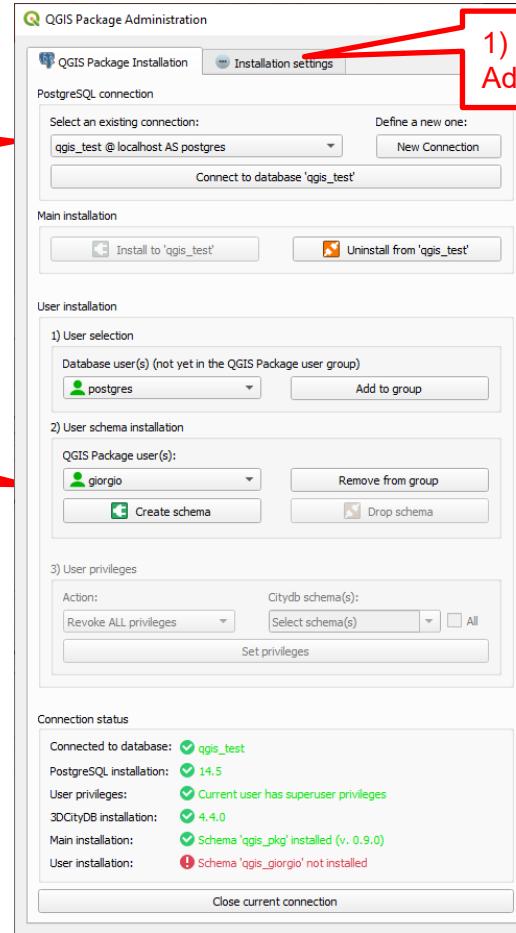

2) **Removal of the 3DCityDB-Tools plugin** from QGIS

- This operation can be carried out by any user
- The plugin can be uninstalled from the \Plugins\Manage and Install Plugins... Menu in QGIS
- Alternatively, it can be uninstalled manually by simply removing the plugin folder

Drop user schema

Motivation

QGIS Package in a nutshell

- It represents the **server-side part** of the QGIS plugin
 - Most of the actions carried out from the QGIS GUI can be actually performed also by interacting directly with the database (e.g. using **PgAdmin**)
- It can be installed and used independently from the QGIS client-side part
 - E.g. with FME, or programmatically via Python, SQLAlchemy, etc.
- It requires
 - PostgreSQL **v. 10 or higher**
 - An existing installation of the 3DCityDB **v. 4.x**
- All relevant entities are installed in the "**qgis_pkg**" database schema
 - Database types
 - Triggers and trigger functions
 - Functions
 - Tables, mostly used as templates for the user schemas

QGIS Package in a nutshell

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

The database administrator can:

- Create user schemas
- Grant/revoke privileges per user and per citydb schema
- Create, refresh, drop layers
- Drop user schemas

The required SQL functions are all available in schema **qgis_pkg**.

QGIS Package: Create user schemas

The database administrator can create user schemas for specific database users.

For example:

- User "giorgio" -> schema "qgis_giorgio"
- User "konstantinos" -> schema "qgis_konstantinos"
- User "postgres" -> schema "qgis_postgres"

Each user schema will be used only by the corresponding user

Each user schema is accessible only by the corresponding user (and the database superusers)

In a user schema all necessary tables, updatable views, materialized views etc. will be created

SQL example

```
-- Create the schema for user "giorgio". It will create schema "qgis_giorgio" in the current database
SELECT qgis_pkg.create_qgis_usr_schema('giorgio');
```

User schema overview

In each user schema (e.g. "qgis_giorgio") some tables are generated upon schema creation:

- Tables **CODELIST**, **CODELIST_LOOKUP_CONFIG** and **CODELIST_VALUE** are used to store codelists and related settings. See slides on **advanced options** for more details
- Tables **ENUMERATION** and **ENUMERATION_VALUE** are used to store enumerations
- Table **EXTENTS** contains the bounding boxes of the citydb schemas and those of the materialized views
- Table **LAYER_METADATA** contains information about generated and refreshed layers
- Table **SETTINGS** is used to store the user's settings (from the QGIS GUI)

>	settings

QGIS Package: User management

The database administrator can grant read-only (ro) or read-write (rw) privileges to the users.

- Privileges can be granted to a specific citydb schema. Please note the **cdb_schema** parameter, requiring a single varchar value with the specific schema name

SQL examples

```
-- Database user "giorgio" is added to group "qgis_pkg_usrgroup_qgis_test", can access data in citydb schema "citydb" of database "qgis_test" with read-only privileges
```

```
SELECT qgis_pkg.grant_qgis_usr_privileges(usr_name := 'giorgio', priv_type := 'ro', cdb_schema := 'citydb');
```

```
-- Database user "konstantinos" is added to group "qgis_pkg_usrgroup_qgis_db", can access data in citydb schema "citydb_2" of database "qgis_db" with read-write privileges
```

```
SELECT qgis_pkg.grant_qgis_usr_privileges(usr_name := 'konstantinos', priv_type := 'rw', cdb_schema := 'citydb_2');
```

QGIS Package: User management

The database administrator can grant read-only (ro) or read-write (rw) privileges to the users

- Alternatively, privileges can be granted to multiple (or all) citydb schemas at the same time; Please note the **cdb_schemas** (with s!) parameter, requiring an array of varchar values containing the schema names, or NULL for all schemas

SQL examples

```
-- Database user "camilo" is added to group "qgis_pkg_usrgroup_starwars", can access data in citydb schemas "alderaan" and "hoth" of the current database "starwars" with read-only privileges
```

```
SELECT qgis_pkg.grant_qgis_usr_privileges(usr_name := 'camilo', priv_type := 'ro', cdb_schemas := ARRAY['alderaan', 'hoth']);
```

```
-- Database user "giorgio" is added to group "qgis_pkg_usrgroup_starwars", can access data in ALL citydb schemas of the current database "starwars" with read-write privileges
```

```
SELECT qgis_pkg.grant_qgis_usr_privileges(usr_name := 'giorgio', priv_type := 'rw', cdb_schemas := NULL);
```

QGIS Package: User management

The database administrator can revoke privileges from the users

SQL examples

-- Database user "giorgio" cannot access anymore data in citydb schema "citydb" of the current database

```
SELECT qgis_pkg.revoke_qgis_usr_privileges('giorgio', 'citydb');
```

-- Database user "camilo" cannot access anymore ANY citydb schemas of the current database

```
SELECT qgis_pkg.revoke_qgis_usr_privileges('camilo');
```

IMPORTANT: The database users are NOT automatically removed from the group "qgis_pkg_usrgroup_{cdb_schema}". If required, the administrator must remove them manually (or use the QGIS plug-in GUI).

-- Database user "giorgio" is removed from group "qgis_pkg_usrgroup_starwars" and won't be able to use the QGIS plugin anymore for the database "starwars"

```
REVOKE qgis_pkg_usrgroup_starwars FROM giorgio;
```

QGIS Package: Layer management

The database administrator can create layers with function **qgis_pkg.create_layers(...)**.

- All materialized views and updatable views are created, but only if corresponding data exist in the database
- The user can create layers only for selected CityGML modules using the similar functions:
 - **qgis_pkg.create_layers_bridge(...)**
 - **qgis_pkg.create_layers_building(...)**
 - ...
 - **qgis_pkg.create_layers_waterbody(...)**
- All functions are in schema **qgis_pkg** and have the same signature (see next slide)

Function

```
qgis_pkg.create_layers(usr_schema, cdb_schema [, perform_snapping] [, digits]
[, area_poly_min] [, bbox_corners_array] [, is_geographic] [, force_layer_creation])
```

Parameter	Type	Description
usr_schema	varchar	The database user schema, e.g. "qgis_giorgio".
cdb_schema	varchar	the citydb schema where data are stored, e.g. "citycb", or "citydb2".
perform_snapping	integer	DEFAULT 0 (i.e. disabled). If 1, geometry simplification is performed. Unused if perform_snapping is set to 0.
digits	integer	DEFAULT 3. Number of decimal positions to keep during geometry simplification. Unused if perform_snapping is set to 0.
area_poly_min	numeric	DEFAULT 0.001 [m ²]. Minimum polygon area during geometry simplification. Unused if perform_snapping is set to 0.
bbox_corners_array	numeric[]	DEFAULT Null, i.e. the extents of the whole <i>cdb_schema</i> . Otherwise, extents of the materialized views to be created, e.g. {x_min, y_min, x_max, y_max}. Coordinates must be in the same SRS as the <i>cdb_schema</i> !
is_geographic	boolean	DEFAULT False. True is the coordinate system of the citydb schema has geographic coordinates, False if it has projected coordinates.
force_layer_creation	boolean	DEFAULT False. Otherwise: force creation of all layers, also the empty ones.

SQL examples

-- For user "giorgio", create all layers for existing data in citydb schema "citydb"

```
SELECT qgis_pkg.create_layers('giorgio', 'citydb');
```

-- For user "giorgio", create all layers for existing data in citydb schema "citydb2" and perform geometry simplification with 2 decimal places and 0.01 m² minimum area for polygons

```
SELECT qgis_pkg.create_layers('giorgio', 'citydb', 1, 2, 0.01);
```

-- For user "camilo", create all building module layers for existing data in citydb schema "vienna"

```
SELECT qgis_pkg.create_layers_building('camilo', 'vienna');
```

-- For user "konstantinos", create all waterbody module layers for existing data in citydb schema "alderaan" within a certain bounding box. The bounding box is defined by the lower-left and upper-right coordinates (i.e. x_min, y_min, x_max, y_max)

```
SELECT qgis_pkg.create_layers_waterbody('konstantinos', 'alderaan', bbox_corners_array := '{10, 20, 110, 220}');
```

QGIS Package: Layer management

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

SQL examples

-- The following query works, but actually it is not written in a user-friendly way.

```
SELECT qgis_pkg.create_layers('giorgio', 'citydb', 1, 2, 0.01);
```

-- In general, therefore, it is always a good habit to use **named parameters** when calling functions!

```
SELECT qgis_pkg.create_layers(  
    usr_name := 'giorgio',  
    cdb_schema := 'citydb',  
    perform_snapping := 1,  
    digits := 2,  
    area_poly_min := 0.01)
```

QGIS Package: Layer management

After creating the layers, you may (optionally) want to register also their bounding box in the EXTENTS table of the respective qgis_schema. This will enable the plugin in QGIS to "see" and represent the extents also from the plugin GUI.

SQL examples

-- In user schema "qgis_giorgio", update the extents for the whole dataset in citydb schema "citydb"

```
SELECT qgis_pkg.upsert_extents('qgis_giorgio', 'citydb', 'db_schema');
```

-- In user schema "qgis_giorgio", update the extents for the user-defined bounding box in citydb schema "citydb"

```
SELECT qgis_pkg.upsert_extents(  
    usr_schema := 'qgis_giorgio',  
    cdb_schema := 'citydb',  
    cdb_bbox_type := 'm_view', -- must be one of ('db_schema', 'm_view', 'qgis')  
    cdb_envelope := ST_Envelope('LINESTRING(232038 480366, 232600 480856)::geometry),  
    is_geographic := FALSE);
```

Please note: the *cdb_envelope* parameter requires a PostGIS geometry that is a polygon. As long as this requirement is fulfilled, other PostGIS functions can be used, for example:

- ST_GeomfromText('POLYGON(...))')
- ST_MakePolygon(...)

The SRID can be omitted as it is automatically set based on the one from the selected citydb schema. The coordinates must be however in the same CRS of the selected citydb!

QGIS Package: Layer management

Motivation
Plugin overview
Software installation
Software use

Current limitations
QGIS Package
Resources

The database administrator can refresh the materialized views with function **qgis_pkg.refresh_layers(...)**.

- All materialized views created before will be refreshed. This is necessary every time the layers are generated (or re-generated using a different bounding box).
- The user can refresh the materialized views only for selected CityGML modules using the similar functions:
 - **qgis_pkg.refresh_layers_bridge(...)**
 - **qgis_pkg.refresh_layers_building(...)**
 - ...
 - **qgis_pkg.refresh_layers_waterbody(...)**
- All functions are in schema qgis_pkg and have the same signature (see next slide)

QGIS Package: Layer management

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

Function

qgis_pkg.refresh_layers(usr_schema, cdb_schema)

Parameter	Type	Description
usr_schema	varchar	The database user schema, e.g. "qgis_giorgio".
cdb_schema	varchar	the citydb schema where data are stored, e.g. "citycb", or "citydb2".

SQL examples

-- In user schema "qgis_giorgio", refresh all materialized views in citydb schema "citydb"

SELECT qgis_pkg.refresh_layers('qgis_giorgio', 'citydb');

-- In user schema "qgis_konstantinos", refresh all waterbody module materialized views in citydb schema "alderaan"

SELECT qgis_pkg.refresh_layers_waterbody('qgis_konstantinos', 'alderaan');

QGIS Package: Layer management

The database administrator can drop layers with function **qgis_pkg.drop_layers(...)**.

- All existing layers in the selected user schema and related to the selected citydb schema will be dropped
- The user can drop layers only for selected CityGML modules using the similar functions:
 - **qgis_pkg.drop_layers_bridge(...)**
 - **qgis_pkg.drop_layers_building(...)**
 - ...
 - **qgis_pkg.drop_layers_waterbody(...)**
- All functions are in schema **qgis_pkg** and have the same signature (see next slide)

QGIS Package: Layer management

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

Function

qgis_pkg.drop_layers(usr_schema, cdb_schema)

Parameter	Type	Description
usr_schema	varchar	The database user schema, e.g. "qgis_giorgio".
cdb_schema	varchar	the citydb schema where data are stored, e.g. "citycb", or "citydb2".

SQL examples

-- In user schema "qgis_giorgio", drop all layers related to citydb schema "citydb"

SELECT qgis_pkg.drop_layers('qgis_giorgio', 'citydb');

-- In user schema "qgis_konstantinos", drop all waterbody module layers related to citydb schema "alderaan"

SELECT qgis_pkg.drop_layers_waterbody('qgis_konstantinos', 'alderaan');

QGIS Package: Detail views

Detail views are children tables containing additional layer data (e.g. generic attributes, external references, etc.)

They can be created and dropped in a similar way as normal layers. If created, they will be used (also) by the plugin GUI in QGIS to link these views to the attribute forms as nested tables.

Important: they must be created with the same extents (bounding box) used for the layers

SQL examples

-- For user "giorgio", create the detail views for citydb schema "citydb"

```
SELECT qgis_pkg.create_details_view('giorgio', 'citydb');
```

-- For user "giorgio", create the detail views for citydb schema "citydb" inside the user-defined bounding box

```
SELECT qgis_pkg.create_detail_view(  
    usr_name := 'giorgio',  
    cdb_schema := 'citydb',  
    bbox_corners_array := ARRAY[232038, 480366, 232600, 480856],  
    is_geographic := FALSE);
```

-- In user schema "qgis_giorgio", drop the detail views for citydb schema "citydb"

```
SELECT qgis_pkg.drop_detail_view('qgis_giorgio', 'citydb');
```

QGIS Package: Drop user schema

Motivation
Plugin overview
Software installation
Software use
Advanced options
Software uninstall
Current limitations
QGIS Package
Resources

The database administrator can drop a user schema

FIRST, revoke privileges of the user for all citydb schemas, THEN drop the user schema.
Please refer to the previous slides for more details about user privileges.

SQL example

```
-- First revoke all ro/rw privileges of user "giorgio" for all citydb schemas
SELECT qgis_pkg.revoke_qgis_usr_privileges('giorgio');

-- Then drop the layers using the drop_layer_x functios
SELECT qgis_pkg.drop_layers_building('qgis_giorgio');
SELECT qgis_pkg.drop_layers_bridge('qgis_giorgio');

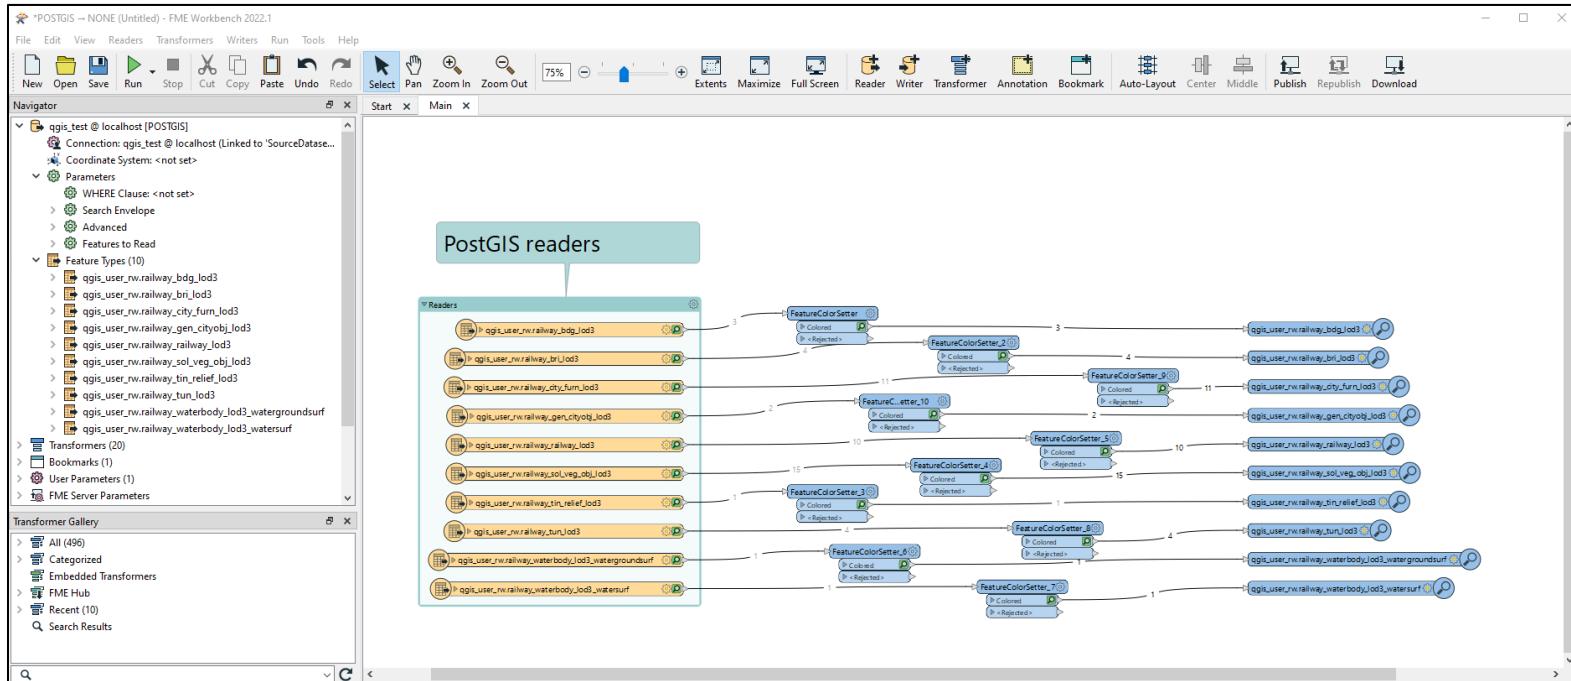

...
-- Then drop the user schema
DROP SCHEMA qgis_giorgio CASCADE;
-- Optionally (if necessary) remove user "giorgio" from the "qgis_pkg_usrgroup_qgis_test" associated to database
-- "qgis_test"
REVOKE qgis_pkg_usrgroup_qgis_test FROM giorgio;
```

QGIS Package via FME

This is a simple example of how the QGIS package can be used via FME

- Simply connect to the 3D City Database and import the views with **PostGIS readers**

The screenshot shows the GitHub repository page for `tudelft3d / 3DCityDB-Tools-for-QGIS`. The repository is public and has 499 commits. The main page displays a list of recent commits, including updates to functions.sql, i18n files, icons, images, test datasets, user guides, and plugin restructuring. The repository is associated with PostgreSQL, QGIS, CityGML, and QGIS3-Plugin. It has 30 stars, 4 forks, and 4 watchers. A release section shows Version 0.8.0 (Latest) and four other releases. A packages section is also present.

This repository contains code of a QGIS plugin that facilitates data handling of the CityGML 3D City Database.

QGIS Plug-in repository

- <https://plugins.qgis.org/plugins/citydb-tools/>

The screenshot shows a web browser displaying the QGIS Plugin Repository. The URL in the address bar is plugins.qgis.org/plugins/citydb-tools/. The page title is "3DCityDB Tools". The main content area displays the "3DCityDB Tools" plugin, which has a green icon featuring a stylized QGIS logo and a cityscape. Below the icon, it says "Plugin ID: 2984" and "Tools to visualize and manipulate CityGML 2.0 data stored in the 3D City Database". It also shows a rating of "★★★★★ (191) votes". A large green "Download latest" button is prominently displayed. At the bottom of the plugin card, there are three tabs: "About", "Details", and "Versions".

This plugin connects to the 3D City Database (v. 4.x) for PostgreSQL/PostGIS. It consists of:

- The "Layer Loader": It loads data as "classical" layers into QGIS. All CityGML LoDs are supported, as well as multiple Citydb schemas and multiple database users. Feature attributes can be edited, changes are stored back directly into the database;
- The "Bulk Deleter": It allows to clean up the database, or to delete selected feature types;
- The "QGIS Package Administrator": It allows to install the server-side part of the plug-in and to manage database user privileges.

On the GitHub repository further resources are provided: the Installation and user manual, as well as some test datasets can be downloaded.

Test datasets

- In the GitHub repository, you will find test datasets that you can import into the 3DCityDB (using the Importer/Exporter) to test the 3DCityDB-Tools plugin. They are located in subfolder \test_datasets
 - The test datasets are:
 - CityGML_2.0_Test_Dataset_2022-03-11.zip (aka "Railway")
 - FZK-Haus-LoD-all-KIT-IAI-KHH-B36-V1.zip (aka "Kit House")
 - DenHaag_bdg_lod2.zip
 - You can find links to many additional free and open CityGML/CityJSON datasets at:
 - Awesome CityGML: <https://github.com/OloOcki/awesome-citygml>
 - 3D Geoinformation group @ TU Delft: <https://3d.bk.tudelft.nl/opendata/opencities/>

Enjoy! ☺
